1 Overview

Features

- 8-bit serial peripheral interface (daisy chain capable SPI) for control and diagnosis
- CMOS compatible parallel input pins for four channels
- Selectable AND- / OR-combination for parallel inputs (PWM control)
- Load type configuration via SPI (bulbs or LEDs) for optimized load control
- Very low stand-by current
- Device ground independent from load ground
- Green Product (RoHS-Compliant)
- AEC Qualified

TSON-24-1

Description

The BTS56033-LBB is a six channel high-side smart power switch in TSON-24-1 package providing embedded protective functions. It is specially designed to control standard exterior lighting in automotive applications. In order to use the same hardware, the device can be configured to bulb or LED mode. As a result, both load types are optimized in terms of switching and diagnosis behavior.

It is designed to drive exterior lamps up to 27 W and 10 W, or the equivalent LED light.

Table 1 Product Summary

| | | |
|--|------------------|----------------|
| Operating Voltage Power Switch | V_S | 5.5 ... 28 V |
| Logic Supply Voltage | V_{DD} | 3.8 ... 5.5 V |
| Over Voltage Protection | $V_{S(AZ,min)}$ | 42 V |
| Maximum Stand-By Current at 25 °C | $I_{VS(STB)}$ | 1 μ A |
| Maximum ON State Resistance at $T_j = 150$ °C 39 m Ω channels (Channel 2, 3, 4) | $R_{DS(ON,max)}$ | 78 m Ω |
| Maximum ON State Resistance at $T_j = 150$ °C 110 m Ω channels (Channel 1, 5, 6) | $R_{DS(ON,max)}$ | 220 m Ω |
| SPI Access Frequency | $f_{SCLK(max)}$ | 3 MHz |

Configuration and status diagnosis are done via SPI. An 8-bit serial peripheral interface (SPI) is used. The SPI is daisy chain capable.

| Type | Package | Marking |
|--------------|-----------|--------------|
| BTS56033-LBB | TSON-24-1 | BTS56033-LBB |

The device provides a current sense signal per channel that is multiplexed to the diagnosis pin IS. It can be enabled and disabled via SPI commands. An over temperature flag per output is provided in the SPI diagnosis word. A multiplexed switch bypass monitor provides short-circuit to V_S diagnosis.

39 m Ω channels can be configured to bulb or LED mode for maximum flexibility.

The BTS56033-LBB provides a fail-safe feature via a Limp Home Input (LHI) pin and direct Input pins.

The power transistors are built by N-channel vertical power MOSFETs with charge pumps. The device is monolithically integrated in SMART technology.

Applications

- High-side power switch for 12 V in automotive or industrial applications such as lighting, heating, motor driving, energy and power distribution
- Especially designed for standard exterior lighting like position light, tail light, brake light, parking light, license plate light, indicators and equivalent in the LED technology
- Replaces electromechanical relays, fuses and discrete circuits

Protective Functions

- Reverse battery protection with external components
- Short circuit to ground protection
- Stable behavior at under voltage
- Current limitation
- Absolute and dynamic temperature sensor
- Thermal shutdown with latch after a limited amount of retries
- Overvoltage protection
- Loss of ground protection
- Electrostatic discharge protection (ESD)

Diagnostic Functions

- Multiplexed proportional load current sense signal (IS)
- Enable function for current sense signal configurable via SPI
- High accuracy of current sense signal at wide load current range
- Current sense ratio (k_{ILIS}) configurable for LEDs or bulbs
- Very fast diagnosis in LED mode
- Feedback on over temperature via SPI
- Short circuit to V_S detection
- Monitoring of Input pins status

Application Specific Functions

- Fail-safe activation via LHI pin and control via input pins
- Enhanced electromagnetic compatibility (EMC) for bulbs as well as LEDs
- LED mode selection available
- SPI with daisy chain capability
- Switch bypass monitoring for detecting short circuit to V_S

2 Block Diagram

Figure 1 Block Diagram BTS56033-LBB

2.1 Terms

Figure 2 shows all terms used in this data sheet, with associated convention for positive values.

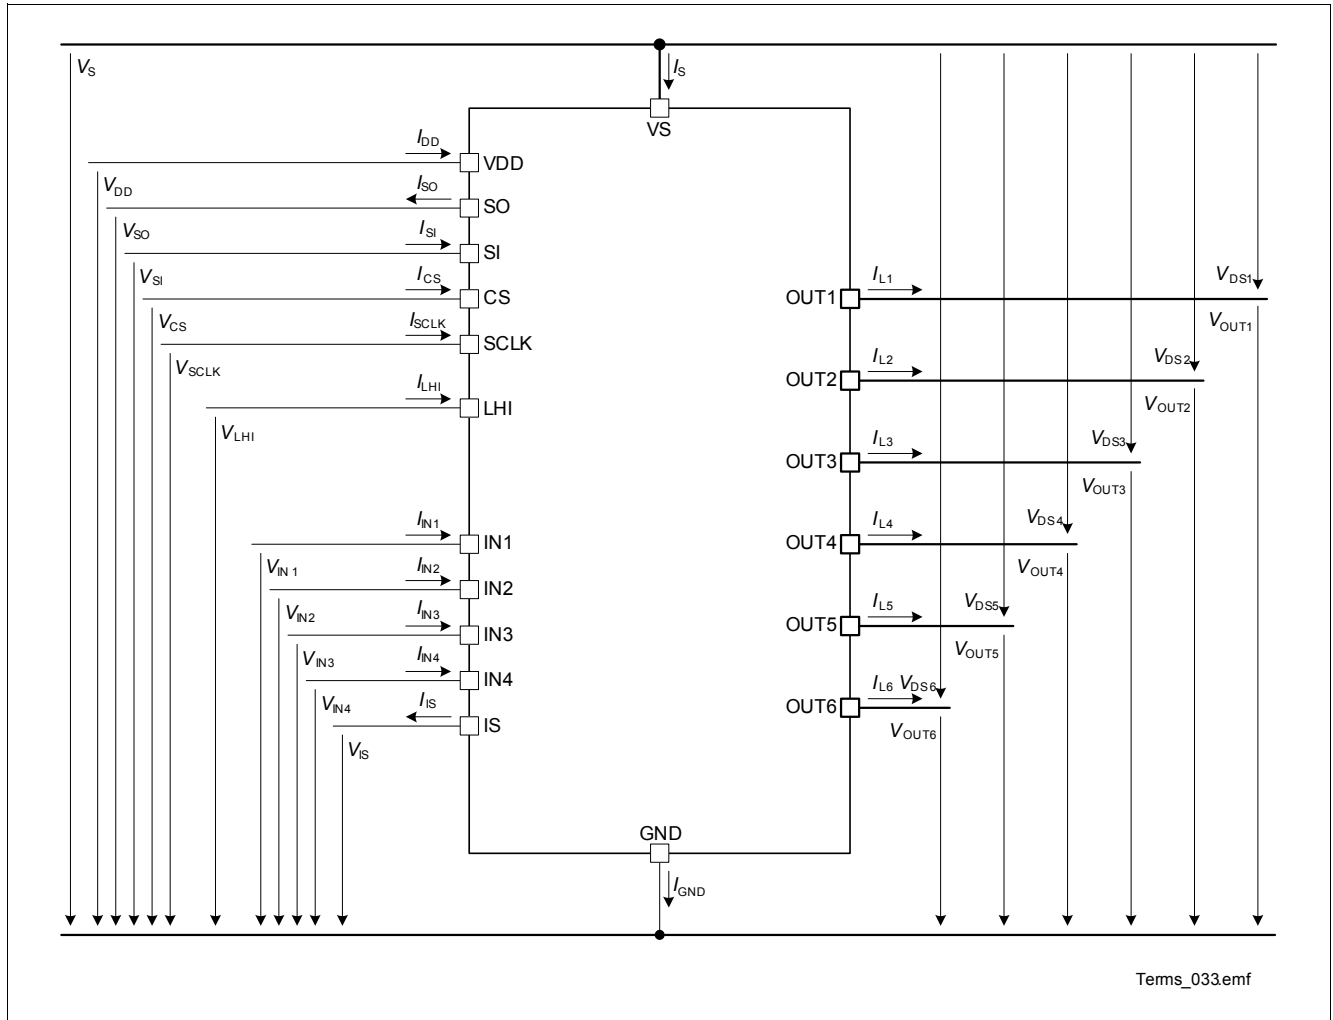

Figure 2 Voltage and Current Definition

In all tables of electrical characteristics, symbols related to channels without channel number are valid for each channel separately (e.g. V_{DS} specification is valid for $V_{DS1} \dots V_{DS6}$).

All SPI register bits are marked as follows: ADDR.PARAMETER (e.g. **HWCR.STB**) with the exception of the bits in the Diagnosis frames which are marked only with PARAMETER (e.g. **VSMON**).

3 Pin Configuration

3.1 Pin Assignment BTS56033-LBB

Figure 3 Pin Configuration TSON-24-1

3.2 Pin Definitions and Functions

| Pin | Symbol | I/O | Function |
|---|--------|-----|--|
| Power Supply Pins | | | |
| 25 | VS | – | Positive power supply for high-side power switch |
| 1 | GND | – | Ground connection |
| 2 | VDD | – | Logic supply (5 V) |
| SPI & Diagnosis Pins | | | |
| 3 | SO | O | Serial output of SPI interface |
| 4 | SI | I | Serial input of SPI interface (“high” active) |
| 5 | SCLK | I | Serial clock of SPI interface (“high” active) |
| 6 | CS | I | Chip select of SPI interface (“low” active); Integrated pull up to VDD |
| 12 | IS | O | Current sense output signal |
| Limp Home Input Pin (integrated pull-down, leave unused Limp Home Input pin unconnected) | | | |
| 7 | LHI | I | Limp home activation signal (“high” active) |
| Parallel Input Pins (integrated pull-down, leave unused pins unconnected) | | | |
| 8 | IN1 | I | Input signal of channel 1 (“high” active) |
| 9 | IN2 | I | Input signal of channel 2 (“high” active) |
| 10 | IN3 | I | Input signal of channel 3 (“high” active) |
| 11 | IN4 | I | Input signal of channel 4 (“high” active) |
| Power Output Pins | | | |
| 23, 24 ¹⁾ | OUT1 | O | Protected high-side power output of channel 1 |
| 21, 22 ¹⁾ | OUT2 | O | Protected high-side power output of channel 2 |
| 19, 20 ¹⁾ | OUT3 | O | Protected high-side power output of channel 3 |
| 17, 18 ¹⁾ | OUT4 | O | Protected high-side power output of channel 4 |
| 15, 16 ¹⁾ | OUT5 | O | Protected high-side power output of channel 5 |
| 13, 14 ¹⁾ | OUT6 | O | Protected high-side power output of channel 6 |

1) All outputs pins of each channel must be connected together on the PCB. All pins of an output are internally connected together. PCB traces have to be designed to withstand the maximum current which can flow.

4 Electrical Characteristics

4.1 Absolute Maximum Ratings

$T_j = -40$ to $+150$ °C; all voltages with respect to ground

Typical resistive loads connected to the outputs (unless otherwise specified):

39 mΩ channels: $R_L = 6.8$ Ω (33 Ω when **LGCR.LEDn** = "1")

110 mΩ channels: $R_L = 18$ Ω

Table 2 Absolute Maximum Ratings¹⁾

| Parameter | Symbol | Values | | | Unit | Note / Test Condition | Number |

- 1) Not subject to production test, specified by design.
- 2) Device is mounted on an FR4 2s2p board according to Jedec JESD51-2,-5,-7 at natural convection; The product (chip and package) was simulated on a 76.4 * 114.3 * 1.5 mm board with 2 inner copper layers (2 * 70 μ m Cu, 2 * 35 μ m Cu). Where applicable, a thermal via array under the package contacted the first inner copper layer.
- 3) EOL tests according to AECQ100-012. Threshold limit for short circuit failures: 100 ppm. Please refer to the legal disclaimer for short-circuit capability at the end of this document.
- 4) R_i is the internal resistance of the load dump pulse generator.
- 5) Current limitation is a protection feature. Protection features are not designed for continuous repetitive operation.
- 6) Pulse shape represents inductive switch OFF: $I_{D(t)} = I_D(t) \times (1 - t / t_{pulse})$; $0 < t < t_{pulse}$
- 7) Pulse shape represents inductive switch OFF: $I_{D(t)} = I_D(t) \times (1 - t / t_{pulse})$; $0 < t < t_{pulse}$
- 8) ESD resistivity, HBM according to ANSI/ESDA/JEDEC JS-001-2010
- 9) ESD susceptibility, Charged Device Model "CDM" EIA/JESD22-C101 or ESDA STM5.3.1

Notes

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

4.2 Thermal Resistance

Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to www.jedec.org.

Table 3 Thermal Resistance

| Parameter | Symbol | Values | | | Unit | Note / Test Condition | Number |
|-----------------------------|-------------|--------|------|------|------|---|---------|
| | | Min. | Typ. | Max. | | | |
| Junction to Soldering Point | R_{thJSP} | – | 2 | – | K/W | ¹⁾ $T_{j(0)} = 105\text{ °C}$ measured to pin 25 | P_4.2.1 |
| Junction to Ambient | R_{thJA} | – | 21 | – | K/W | ¹⁾²⁾ $T_{j(0)} = 105\text{ °C}$ | P_4.2.2 |

1) Not subject to production test, specified by design.

2) Specified R_{thJA} values is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; The product (chip and package) was simulated on a 76.4 * 114.3 * 1.5 mm board with 2 inner copper layers (2 * 70 μm Cu, 2 * 35 μm Cu). Where applicable, a thermal via array under the package contacted the first inner copper layer.

5 Power Supply

The BTS56033-LBB is supplied by two voltage sources:

- V_S (analog supply voltage)
- V_{DD} (digital supply voltage)

The V_S supply line is connected to a battery feed and used for the driving circuitry of the power stages, while V_{DD} is used for the SPI logic and for driving SO pin.

V_S and V_{DD} supply voltages have an undervoltage detection circuit, which prevents the activation of the associated function in case the measured voltage is below the undervoltage threshold. More in detail:

- An undervoltage on V_{DD} supply prevents SPI communication. SPI registers are reset to default values. The retry counters used to protect the channels are reset therefore the channels are in “unlimited restart” mode.
- An undervoltage on V_S supply switches OFF all channels, even in Limp Home mode. The channels are enabled again as soon as $V_S = V_{S(OP)}$.

The voltage at pin VS is also monitored. In case of a negative voltage transient resulting in $V_S < V_{SMON}$ with $DCR.MUX \neq "111_B"$, any SPI command sent by the micro-controller is not accepted (see [Chapter 9.5](#) for further details).

An overview of channel behavior according to different V_S and V_{DD} supply voltages is shown in [Table 4](#) (the table is valid after a successful supply voltage ramp-up).

Table 4 Device capability as function of V_S and V_{DD}

| | $V_{DD} \leq V_{DD(PO)}$ ($V_{DD(PO)} = P_5.3.17$) | $V_{DD} > V_{DD(PO)}$ |
|---|--|--|
| $V_S \leq V_{SMON}$ ($V_{SMON} = P_5.3.12$) | Channels are OFF | Channels are OFF |
| | SPI registers reset | SPI registers protected ¹⁾ |
| | SPI communication not available ($f_{SCLK} = 0$ MHz) | SPI communication available ²⁾ ($f_{SCLK} = 3$ MHz) |
| | Limp Home mode not available | Limp Home mode not available |
| $V_{SMON} < V_S \leq V_{S(UV)}$ ($V_{S(UV)} = P_5.3.2$) | Channels are OFF | Channels are OFF |
| | SPI registers reset | SPI registers available |
| | SPI communication not available ($f_{SCLK} = 0$ MHz) | SPI communication available ($f_{SCLK} = 3$ MHz) |
| | Limp Home mode available (channels are OFF) | Limp Home mode available (channels are OFF) |
| $V_S > V_{S(UV)}$ ³⁾ | Channels cannot be controlled by SPI | Channels can be switched ON and OFF |
| | SPI registers reset | SPI registers available |
| | SPI communication not available ($f_{SCLK} = 0$ MHz) | SPI communication available ($f_{SCLK} = 3$ MHz) |
| | Limp Home mode available | Limp Home mode available |

1) If $DCR.MUX \neq 111_B$, otherwise SPI registers are available.

2) SPI response depends on $DCR.MUX$ value. See [Chapter 9.5](#) for further details.

3) The undervoltage condition on V_S supply must be considered. See [Chapter 5.2.1](#) for further details.

5.1 Operation modes

BTS56033-LBB has the following operation modes:

- Stand-by mode
- Idle mode
- Ready mode
- Operative mode
- Limp Home mode

The transition between operation modes is determined according to these variables:

- logic level at LHI pin
- logic level at INn pins
- **DCR.MUX** bits state
- **OUT.OUTn** bits state

The state diagram including the possible transitions is shown in **Figure 10**. The behavior of BTS56033-LBB as well as some parameters may change in dependence from the operation mode of the device. Furthermore, due to the undervoltage detection circuitry which monitors V_S and V_{DD} supply voltages, some changes within the same operation mode can be seen accordingly.

Figure 10 Operation Mode state diagram

There are three parameters describing the behavior of BTS56033-LBB:

- status of output channels
- status of SPI registers
- status of SPI communication

It is necessary to set **DCR.MUX** to a value different from 111_B to command a switch ON of one or more channels. In alternative it is necessary to set the LHI to "high" - in this case the logic state of the Input pins is reflected to the outputs (if there is no undervoltage condition on V_S supply).

Table 5 shows the correlation between device operation modes, V_S and V_{DD} supply voltages, and the state of the most important functions (channel status, SPI communication and SPI registers).

Table 5 Device function in relation to operation modes, V_S and V_{DD} voltages

| Operation Mode | Function | $V_S \leq V_{SMON}$ | $V_{SMON} > V_S \leq V_{S(UV)}$ | $V_S > V_{S(UV)}$ |
|----------------|---------------|---------------------------------------|---------------------------------------|--|
| Stand-by | Channels | OFF | OFF | OFF |
| | SPI comm. | available ¹⁾ | available ¹⁾ | available ¹⁾ |
| | SPI registers | available ¹⁾ | available ¹⁾ | available ¹⁾ |
| Idle | Channels | OFF | OFF | OFF |
| | SPI comm. | all commands rejected ¹⁾ | available ¹⁾ | available ¹⁾ |
| | SPI registers | available ¹⁾ | available ¹⁾ | available ¹⁾ |
| Ready | Channels | OFF | OFF | OFF |
| | SPI comm. | available ¹⁾ | available ¹⁾ | available ¹⁾ |
| | SPI registers | available ¹⁾ | available ¹⁾ | available ¹⁾ |
| Operative | Channels | OFF | OFF | follow OUT.OUTn and/or Input pins |
| | SPI comm. | all commands rejected ¹⁾ | available ¹⁾ | available ¹⁾ |
| | SPI registers | available ¹⁾ | available ¹⁾ | available ¹⁾ |
| Limp Home | Channels | OFF | OFF | follow Input pins |
| | SPI comm. | available (read-only) ¹⁾²⁾ | available (read-only) ¹⁾²⁾ | available (read-only) ¹⁾²⁾ |
| | SPI registers | reset | reset | reset |

1) If $V_{DD} > V_{DD(PO)}$, otherwise not available or in reset.

2) **HWCR.CTC** and **HWCR.RST** commands are accepted.

5.1.1 Power-up

The Power-up condition is entered when one of the supply voltages (V_S or V_{DD}) is applied to the device. Both supplies are rising until they are above the undervoltage thresholds $V_{S(OP)}$ and $V_{DD(PO)}$ therefore the internal power-on signals are set.

5.1.2 Stand-by mode

When BTS56033-LBB is in Stand-by mode, all outputs are OFF. The SPI registers can be programmed if $V_{DD} > V_{DD(PO)}$. The current consumption is minimum (see parameter $I_{VS(STB)}$). The circuitry that monitors V_S versus the threshold V_{SMON} is disabled, allowing the programming of the registers. Even if one Input pin is set to "high" or if one **OUT.OUTn** bit is set to "1", all outputs stay switched OFF.

5.1.3 Idle mode

In Idle mode, the internal supply circuitry is working and the device current consumption is increased. All channels are OFF and a command to switch ON one or more outputs (either via SPI or via Input pins) is accepted and executed, bringing the device into Operative mode.

5.1.4 Ready mode

In Ready mode, one or more outputs received a command to switch ON (either via SPI or via Input pins). Nevertheless all outputs are OFF because of **DCR.MUX** bits still set to 111_B. It is necessary to change the value of those bits to bring the device into Operative mode and switch ON the channels.

5.1.5 Operative mode

Operative mode is the normal operation mode of BTS56033-LBB when no Limp Home condition is set and one or more outputs are switched ON. Device current consumption is specified by parameter I_{GND} . An undervoltage condition on V_{DD} supply voltage brings the device into Stand-by mode (if all Input pins are set to “low”) or into Ready mode (if at least one Input pin is set to “high”).

5.1.6 Limp Home mode

BTS56033-LBB enters Limp Home mode when LHI pin is set to “high”. SPI registers are reset to the default values after $t_{LHI(ac)}$ from the rising edge at pin LHI (see **Figure 11** for further details). SPI communication is possible but only in read-only mode (SPI registers can be read but cannot be written, meaning that current sensing is not available). When $V_S \leq V_{SMON}$ and **DCR.MUX** \neq 111_B the logic state detected at pin LHI is ignored and the device doesn't enter Limp Home mode.

*Note: The only write commands excepted in Limp Home mode are **HWCR.CTC** and **HWCR.RST** to clear the protection latches.*

Figure 11 Limp Home Activation as function of V_S

5.2 Reset condition

One of the following 3 conditions resets the SPI registers to their default values:

- V_{DD} is not present or below the undervoltage threshold $V_{DD(PO)}$
- LHI pin is set to “high” and $V_S > V_{SMON}$
- a reset command (**HWCR.RST** = 1_B) is executed

In particular, all channels are switched OFF (if the device is not in Limp Home mode with one or more Input pins set to “high”). In case of lack of V_{DD} supply the internal retry counters are disabled therefore all channels are in “unlimited restart” mode.

5.2.1 Undervoltage on V_S

Between $V_{S(OP)}$ and $V_{S(UV)}$ the undervoltage mechanism is triggered. If the device is operative and the supply voltage drops below the undervoltage threshold $V_{S(UV)}$, the logic switches OFF the channels. As soon as the supply voltage V_S is above the minimum operative voltage threshold $V_{S(OP)}$, the channels having either the corresponding Input pin set to “high” or the `OUT.OUTn` bit set to “1” are switched ON again (as shown in [Figure 12](#)).

Figure 12 V_S undervoltage behavior

5.3 Electrical Characteristics

Unless otherwise specified: $V_S = 7\text{ V to }18\text{ V}$, $V_{DD} = 3.8\text{ V to }5.5\text{ V}$, $T_j = -40\text{ °C to }+150\text{ °C}$

Typical values: $V_S = 13.5\text{ V}$, $V_{DD} = 4.3\text{ V}$, $T_j = 25\text{ °C}$

Typical resistive loads connected to the outputs (unless otherwise specified):

39 mΩ channels: $R_L = 6.8\text{ Ω}$ (33 Ω when **LGCR.LEDn** = "1")

110 mΩ channels: $R_L = 18\text{ Ω}$

Table 6 Electrical Characteristics Power Supply

1) Not subject to production test, specified by design.

Note: Characteristics show the deviation of parameter at the given supply voltage and junction temperature.

Typical values show the typical parameters expected from manufacturing at $V_S = 13.5\text{ V}$, $V_{DD} = 4.3\text{ V}$ and $T_j = 25\text{ °C}$

6 Power Stages

The high-side power stages are built by N-channel vertical power MOSFETs with charge pumps. There are six channels implemented in the device. Each channel can be switched on via SPI register **OUT** or via an input pin, when available. Channels 2, 3 and 4 provide a load type configuration for bulbs or LEDs in register **LGCR** (see [Chapter 9.7.4](#)). The load type configuration can be changed in ON- as well as in OFF-state.

6.1 Output ON-State Resistance

The ON-state resistance $R_{DS(ON)}$ depends mainly on the junction temperature T_j . [Figure 13](#) shows the variation of $R_{DS(ON)}$ across the whole temperature range. The value "1" corresponds to the typical $R_{DS(ON)}$ measured at $T_j = 25^\circ\text{C}$.

Figure 13 $R_{DS(ON)}$ variation factor

The behavior in reverse polarity mode is described in [Chapter 7](#).

6.2 Input Circuit

There are two ways of using the input pins in combination with the register **OUT** by programming bit **HWCR.COL** in register **HWCR** (see [Chapter 9.7.6](#)).

- **HWCR.COL** = 0: A channel is switched ON either by the according **OUT.OUTn** bit or by the input pin.
- **HWCR.COL** = 1: A channel is switched ON by the according **OUT.OUTn** bit only, when the input pin is "high". In this configuration, a PWM signal can be applied to the input pin and the channel is activated by the SPI register **OUT** (see [Chapter 9.7.1](#)).

The default state (**HWCR.COL** = 0) is the OR-combination of the input signal and the SPI-bit. In Limp Home Mode (LHI pin set to "high") the combinatorial logic is switched to OR-mode to enable a channel activation via the input pins only.

[Figure 14](#) shows the complete input switch matrix.

The zener diode protects the input circuit against ESD pulses. The current sink to ground ensures that the input signal is low in case of an open input pin.

6.3 Input Status Monitor

The level of the input stage can be monitored via the input status monitor. The input status is indicated in the **OUT** register for the available input pin. After setting the bit **SWCR.SWR** = 1_B, the readout of **OUT.INST_n** shows the state of the input pins.

Figure 14 Input Switch Matrix

6.4 Power Stage Output

The power stages are built to be used in high side configuration (Figure 15).

The power DMOS switches with a dedicated slope, which is optimized in terms of electromagnetic emission (EME). Defined slew rates allow lowest EME during PWM operation at low switching losses.

Figure 15 Power Stage Output

6.4.1 Bulb and LED Mode

Channels 2, 3 and 4 can be configured in bulb and LED mode via the SPI initialization registers LGCR when SWCR.SWR = 0. The default state is LGCR.LEDn = 0. During LED mode the following parameters are changed for an optimized functionality with LED loads: ON-state resistance $R_{DS(ON)}$, switching timings ($t_{delay(ON)}$, $t_{delay(OFF)}$, t_{ON} , t_{OFF}), slew rates dV/dt_{ON} and dV/dt_{OFF} , load current protections $I_{L(LIM)}$ and current sense ratio k_{ILIS} .

6.4.2 Switching Resistive Loads

When switching resistive loads the following switching times and slew rates can be considered.

Figure 16 Switching a Load (resistive)

6.4.3 Switching Inductive Loads

When switching OFF inductive loads with high-side switches, the voltage V_{OUT} drops below ground potential, because the inductance intends to continue driving the current. To prevent the destruction of the device due to overvoltage, there is a voltage clamp mechanism implemented which limits that negative output voltage to a certain level ($V_{DS(CL)}$ ([Chapter 6.5](#))). See [Figure 15](#) for details. Please refer also to [Chapter 7.4](#). The maximum allowed load inductance is limited.

6.4.4 Switching Channels in Parallel

In case of appearance of a short circuit with channels in parallel driving a single load, BTS56033-LBB output stages are not synchronized in the restart event. When all channels connected to the same load are in temperature limitation, the channel which has cooled down the fastest doesn't wait for the other ones to be cooled down as well to restart. Thus, it is not recommended to use the device with channels in parallel.

Note: In case of parallel channel operation, short circuit robustness may be reduced and n_{RSC1} is not guaranteed any more.

6.5 Electrical Characteristics

Unless otherwise specified: $V_S = 7\text{ V to }18\text{ V}$, $V_{DD} = 3.8\text{ V to }5.5\text{ V}$, $T_j = -40\text{ °C to }+150\text{ °C}$

Typical values: $V_S = 13.5\text{ V}$, $V_{DD} = 4.3\text{ V}$, $T_j = 25\text{ °C}$

Typical resistive loads connected to the outputs (unless otherwise specified):

39 mΩ channels: $R_L = 6.8\text{ Ω}$ (33 Ω when **LGCR.LEDn** = "1")

110 mΩ channels: $R_L = 18\text{ Ω}$

Table 7 Electrical Characteristics Power Stages

7 Protection Functions

The device provides embedded protective functions, which are designed to prevent IC destruction under fault conditions described in this data sheet. Fault conditions are considered as “outside” normal operating range. Protective functions are neither designed for continuous nor for repetitive operation.

7.1 Over Load Protection

The load current I_L is limited by the device itself in case of over load or short circuit to ground. 39 mΩ channels have 2 steps of current limitation which are selected automatically depending on the voltage V_{DS} across the power DMOS as show in [Figure 17](#). 110 mΩ channels have 1 step therefore the current limitation threshold is the same across the whole V_{DS} range (see [Figure 18](#)). Please note that $V_{OUT} = V_S - V_{DS}$. The current limitation threshold when $V_{DS} = 5\text{ V}$ is taken as reference.

Current limitation to the value $I_{L(LIM)}$ is realized by increasing the resistance of the output channel, which leads to fast DMOS temperature rise.

Figure 17 Typical Current Limitation variation according to V_{DS} voltage

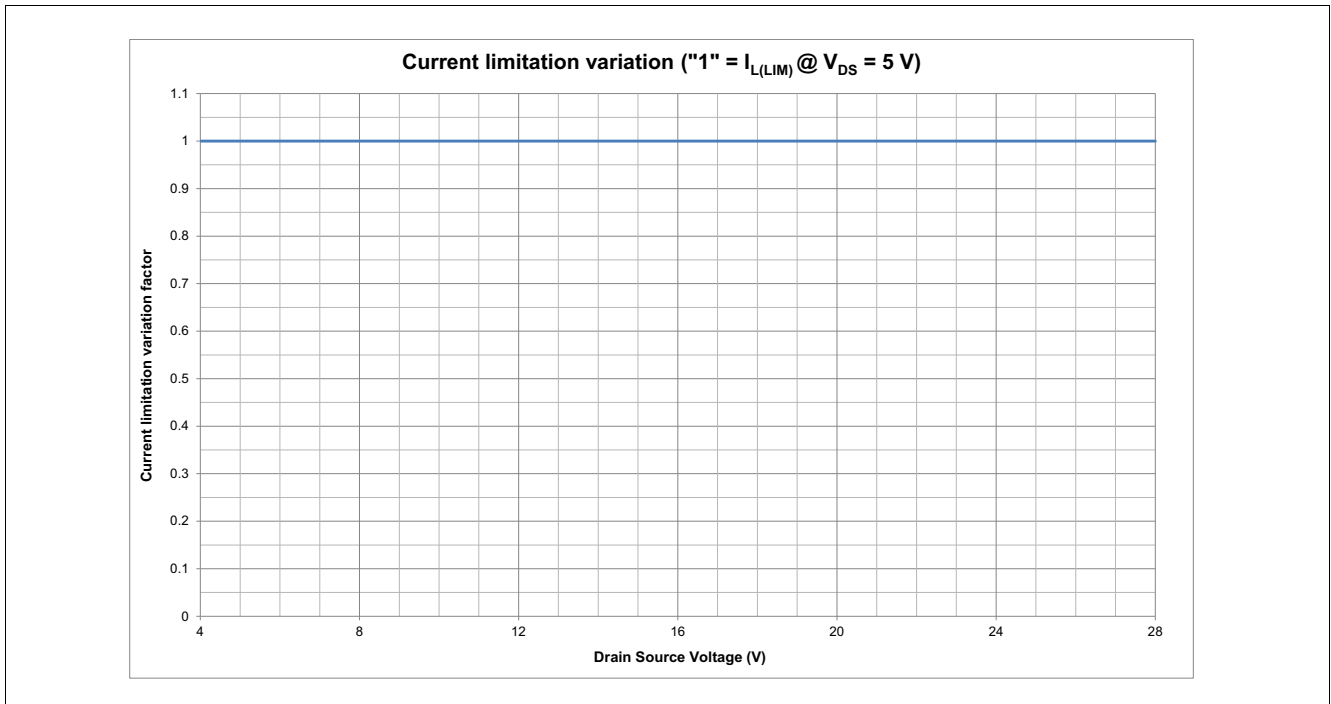

Figure 18 Typical Current Limitation behavior

7.2 Over Temperature Protection

Each channel incorporates both an absolute ($T_{j(SC)}$) and a dynamic ($\Delta T_{j(SW)}$) temperature sensor. An increase of junction temperature T_j above one of the two thresholds ($T_{j(SC)}$ or $\Delta T_{j(SW)}$) switches OFF an overheated channel to prevent destruction. Any protective switch OFF deactivates the output until the temperature has reached an acceptable value.

Each protective switch OFF event increments the error counter by one. The number of automatic reactivations is limited by n_{retry} . If this number of retries is reached the channel turns OFF and latches OFF.

The error information related to the given channel is available on the Standard Diagnosis and Errors Diagnosis. Executing **HWCR.CTC** = 1_B will clear all thermal counters and errors on all channels. If the channel is active (either **OUT.OUTn** = 1_B or **INn** = "high" and **DCR.MUX** $\neq 111_B$) it is turned on immediately after the SPI command. In addition the execution of the reset command (**HWCR.RST** = 1_B) will clear the thermal counters.

For the condition $n < n_{\text{retry}}$ the counter of automatic reactivations is reset by every channel activation if **HWCR.RCR** bit is set to 1. In [Figure 21](#) the different behavior of retry counters according to **HWCR.RCR** bit value can be seen.

In Limp Home Mode, the thermal counters of the protection functions are only operative if V_{DD} is provided in the specified range. Otherwise the counters are not active and all channels are in „unlimited restart“ mode.

In case of the short circuit to ground, current sense ratio (k_{LIS}) is deactivated as soon as $V_{DS} > V_{DS(SB)}$ (Switch bypass monitor threshold). Usually a short circuit to ground condition tends to set $V_{DS} = V_S$ therefore in most of the cases no current sensing diagnostic is possible in short circuit.

The error information related to the given channel are available also on Warnings Diagnosis (**ERRn** bits).

Refer to [Figure 19](#) and [Figure 20](#) for details.

Figure 19 Dynamic Temperature Sensor Operations - Short Circuit

Figure 20 Dynamic and Absolute Temperature Sensor Operations - Overload Condition

Figure 21 Different counter reset according to HWCR. RCR bit value

7.3 Reverse Polarity Protection

In reverse polarity condition, power dissipation is caused by the intrinsic body diode of each DMOS channel as well as each ESD diode of the logic pins. The reverse current through the channels has to be limited by the connected loads. The current through ground pin GND, sense pin IS, logic power supply pin VDD, SPI pins, input pins and Limp Home Input pin has to be limited as well (please refer to the maximum ratings listed on [Chapter 4.1](#)).

Note: No protection mechanism like temperature protection or current limitation is active during reverse polarity.

7.4 Over Voltage Protection

In the case of supply voltages between $V_{S(SC)max}$ and $V_{S(AZ)}$ the output transistors are still operational and follow the input or the **OUT** register. Parameters are not warranted and lifetime is reduced compared to nominal voltage supply.

In addition to the output clamp for inductive loads as described in [Chapter 6.4.3](#), there is a clamp mechanism available for over voltage protection for the logic and all channels.

7.5 Loss of Ground

In case of complete loss of the device ground connection, but loads connected to ground, the BTS56033-LBB securely changes to or stays in OFF-state. Please refer to [Chapter 10](#) where an application setup is described.

7.6 Loss of V_S

In case of loss of V_S connection in ON-state, all inductances of the loads have to be demagnetized through the ground connection or through an additional path from V_S to ground. For example, a suppressor diode is recommended between V_S and GND.

7.7 Electrical Characteristics

Unless otherwise specified: $V_S = 7\text{ V to }18\text{ V}$, $V_{DD} = 3.8\text{ V to }5.5\text{ V}$, $T_j = -40\text{ °C to }+150\text{ °C}$
 typical values: $V_S = 13.5\text{ V}$, $V_{DD} = 4.3\text{ V}$, $T_j = 25\text{ °C}$

Typical resistive loads connected to the outputs (unless otherwise specified):

39 mΩ channels: $R_L = 6.8\text{ Ω}$ (33 Ω when **LGCR.LEDn** = "1")

110 mΩ channels: $R_L = 18\text{ Ω}$

8 Diagnosis

For diagnosis purpose, the BTS56033-LBB provides a current sense signal at pin IS and a diagnosis word via SPI. There is a current sense multiplexer implemented that is controlled via SPI. The sense signal can also be disabled by SPI command. A switch bypass monitor allows to detect a short circuit between the output pin and the battery voltage.

Please refer to [Figure 22](#) for details.

Figure 22 Block Diagram: Diagnosis

For diagnosis feedback at different operation modes, please see [Table 9](#).

Table 9 Operation Modes ¹⁾

| Operation Mode | Input Level OUT . OUTn | Output Level V_{OUT} | Current Sense I_{IS} | Error Flag ERR_COUNTERn ²⁾ | Warning Flag ERRn ³⁾ | DCR . SBM bit |
|---|----------------------------------|---------------------------|---------------------------|---|---|---------------|
| Normal Operation (Channel OFF) | L / 0 (OFF-state) | GND | Z | 0 | 0 | 1 |
| Short Circuit to GND | | GND | Z | 0 | 0 | 1 |
| Thermal shut down | | Z | Z | 0 ²⁾ | 0 ²⁾ | X |
| Short Circuit to V_S | | V_S | Z | 0 | 0 | 0 |
| Open Load | | Z | Z | 0 | 0 | X |
| Normal Operation (Channel ON) | H / 1 (ON-state) | $\sim V_S$ | I_L / k_{ILIS} | 0 | 0 | 0 |
| Current Limitation | | $< V_S$ | Z | 0 | 0 | X |
| Dynamic or Absolute Thermal Limitation → Channel switched OFF | | Z | Z | 0 | 1 | X |
| Dynamic or Absolute Thermal Limitation n_{retry} reached → Channel latched OFF | | Z | Z | 1 ²⁾ | 1 | X |
| Short Circuit to GND | | \sim GND | Z | 0 | 0 | 1 |
| Short Circuit to V_S | | V_S | $< I_L / k_{ILIS}$ | 0 | 0 | 0 |
| Open Load | | V_S | Z | 0 | 0 | 0 |

1) L = "low" level, H = "high" level, Z = high impedance, potential depends on leakage currents and external circuit.
X = undefined.

2) The over temperature flag is set latched and can be cleared by setting **HWCR . CTC** = 1_B.

3) The warning flags are latched until they are reset (see **HWCR . RCR** description).

8.1 Diagnosis Word at SPI

Diagnostic information about the status of each channel is provided through SPI. In the Standard Diagnosis the **ERR_MUX** bit reports if there is a channel which had already enough restarts to reach the maximum allowed number of retries n_{retry} (P_7.7.17). If 2 or more channels are latched OFF due to that, **ERR_MUX** bits aren't enough to identify which channels are OFF. In such cases, it is possible to get an overview channel by channel using **ERR_COUNTERn** bits in Errors Diagnosis (see [Chapter 9.6.2](#))

It is possible to check if one or more channels had some retries during switching ON, although the limit of n_{retry} was not reached. An overview channel by channel of thermal counter status is available using **ERRn** bits in Warnings Diagnosis (see [Chapter 9.6.3](#)).

For both **ERR_COUNTERn** and **ERRn** the information on channel n is given at bit n-1 (e.g. bit 0 indicates status of channel 1).

8.2 Load Current Sense Diagnosis

There is a current sense signal available at pin IS which provides a current proportional to the load current of one selected channel. The selection is done by a multiplexer which is configured via SPI.

8.2.1 Current Sense Signal

The current sense signal (ratio $k_{ILIS} = I_L / I_S$) is provided during ON-state as long as no failure mode occurs. For dedicated channels the ratio k_{ILIS} can be adjusted to the load type (LED or bulb) via SPI register **LGCR**. The accuracy of the ratio k_{ILIS} depends on the load current and temperature. Usually a resistor R_{IS} is connected to the current sense pin. It is recommended to use resistors $1.5 \text{ k}\Omega < R_{IS} < 5 \text{ k}\Omega$. A typical value is $2.7 \text{ k}\Omega$.

The current sense signal of a channel is not active when the channel is OFF or when the protection functions (current limitation, over temperature or dynamic temperature sensors) are active. If the maximum number of automatic reactivations n_{retry} is reached ($n = n_{\text{retry}}$), the current sense signal of the affected channel is deactivated until the reset of the counters by setting **HWCR.CTC** bit to 1.

Details about timings between the current sense signal I_S and the output voltage V_{OUT} and the load current I_L can be found in **Figure 23**.

Figure 23 Current Sense Signal Timings

8.2.2 Current Sense Multiplexer

There is a current sense multiplexer implemented in the BTS56033-LBB that routes the sense current of the selected channel to the diagnosis pin IS. The channel is selected via SPI register **DCR.MUX**. The sense current can also be disabled by SPI register **DCR.MUX**. For details on timing of the current sense multiplexer, please refer to **Figure 24**.

Figure 24 Current Sense Multiplexer Timings

8.2.3 Open Load at ON Diagnosis

If a channel is ON in Open Load condition, a small current can still flow, for example because of humidity. The parameter $I_{L(OL)}$ gives the threshold of recognition for such leakage current. If the voltage measured at the sense resistor R_{SENSE} corresponds to a current $I_{S(OL)}$ ($4 \mu A$), then the current flowing at the output in ON state is within the limits given by $I_{L(OL)}$. Figure 25 shows the sense current behavior once a channel in Open Load at ON condition is selected with the sense current multiplexer. The red curve show a typical product curve. The blue line shows the ideal k_{ILIS} ratio.

Figure 25 Current Sense Ratio in Open Load at ON condition

8.3 Switch Bypass Monitor Diagnosis

To detect short circuit to V_S , there is a switch bypass monitor implemented. In case of short circuit between the output pin OUT and VS in ON-state, the current flows through the power transistor as well as through the short circuit (bypass) with undefined share between the two. As a result, the current sense signal shows lower values than expected by the load current. In OFF-state, the output voltage remains close to V_S potential which leads to a small V_{DS} .

The switch bypass monitor compares the threshold $V_{DS(SB)}$ with the voltage V_{DS} across the power transistor of that channel which is selected by the current sense multiplexer (DCR.MUX). The result of the comparison can be read in SPI register DCR.SBM.

8.4 Gate Back Regulation

To increase the current sense accuracy, the Gate Back Regulation (GBR) function is implemented. This function monitors the V_{DS} voltage at the output and if the value is equal to or lower than $V_{DS(NL)}$ the output DMOS gate is partially discharged. This increases output DMOS resistance so that $V_{DS} = V_{DS(NL)}$ even for very small output currents. The V_{DS} increase allows the current sensing circuitry to work with better accuracy, providing tighter k_{ILIS} values for output currents in the low range.

This function is active by default (**LGCR.GBRn** bits set to “1” after a reset). According to output current, GBR function can be left active or disabled. Even if left active, Gate Back Regulation circuitry may not be working because the measured V_{DS} is bigger than $V_{DS(NL)}$ (depending on output current, junction temperature, output DMOS resistance).

Due to production and temperature variations, GBR circuitry can affect kILIS performance in negative way for some output current values. For this reason, **Table 10** and **Table 11** indicate for which output currents it is necessary to deactivate GBR (setting the corresponding **LGCR.GBRn** bit to “0”) to reach the desired current accuracy. If no indication is given, then the GBR function is assumed to be enabled (**LGCR.GBRn** bit set to “1”). It is recommended to keep GBR circuitry enabled for Open Load at ON diagnosis.

The circuitry that controls GBR function can be deactivated with the following SPI command sequence:

- **SWCR.SWR** = 1 (SPI command: 11001100_B)
- **LGCR.GBRn** = 0 (SPI command: 1101aaaa_B where “aaaa”_B is the new value for **LGCR.GBRn** bits)
- (optional but recommended: **SWCR.SWR** = 0 (SPI command: 11000100_B))

GBR cannot be deactivated for 110mΩ channels.

Refer to **Chapter 9.7** for more details.

8.5 Electrical Characteristics

Unless otherwise specified: $V_S = 7\text{ V to }18\text{ V}$, $V_{DD} = 3.8\text{ V to }5.5\text{ V}$, $T_j = -40\text{ °C to }+150\text{ °C}$

Typical values: $V_S = 13.5\text{ V}$, $V_{DD} = 4.3\text{ V}$, $T_j = 25\text{ °C}$

Typical resistive loads connected to the outputs (unless otherwise specified):

39 mΩ channels: $R_L = 6.8\text{ Ω}$ (33 Ω when **LGCR.LEDn** = "1")

110 mΩ channels: $R_L = 18\text{ Ω}$

Measurement setup used for k_{ILIS} (unless otherwise specified):

Channel 2, 3, 4: when $I_L \leq 1.3\text{ A}$ the channels are ON at the same time with equal I_L , channels 1, 5, 6 have $I_L = 0$

Channel 1, 5, 6: when $I_L \leq 1.3\text{ A}$ the channels are ON at the same time with equal I_L , channels 2, 3, 4 have $I_L = 0$

When $I_L \geq 2.0\text{ A}$ only the measured channel is ON, all other channels have $I_L = 0$

9 Serial Peripheral Interface (SPI)

The serial peripheral interface (SPI) is a full duplex synchronous serial slave interface, which uses four lines: SO, SI, SCLK and CS. Data is transferred by the lines SI and SO at the rate given by SCLK. The falling edge of CS indicates the beginning of an access. Data is sampled in on line SI at the falling edge of SCLK and shifted out on line SO at the rising edge of SCLK. Each access must be terminated by a rising edge of CS. A modulo 8 counter ensures that data is taken only when a multiple of 8 bit has been transferred. The interface provides daisy chain capability with 8-bit SPI devices.

Figure 26 Serial Peripheral Interface

9.1 SPI Signal Description

CS - Chip Select

The system micro controller selects the BTS56033-LBB by means of the CS pin. Whenever the pin is in “low” state, data transfer can take place. When CS is in “high” state, any signals at the SCLK and SI pins are ignored and SO is forced into a high impedance state.

CS “high” to “low” Transition

- The requested information is transferred into the shift register.
- SO changes from high impedance state to “high” or “low” state depending on the signal level at pin SI.

Figure 27 Combinatorial Logic for TER Flag

CS “low” to “high” Transition

- Command decoding is only done, when after the falling edge of CS exactly a multiple (1, 2, 3, ...) of eight SCLK signals have been detected. In case of faulty transmission, the transmission error flag (**TER**) is set and the command is ignored.
- Data from shift register is transferred into the addressed register.

SCLK - Serial Clock

This input pin clocks the internal shift register. The serial input (SI) transfers data into the shift register on the falling edge of SCLK while the serial output (SO) shifts diagnostic information out on the rising edge of the serial clock. It is essential that the SCLK pin is in “low” state whenever chip select CS makes any transition, otherwise the command may be not accepted.

SI - Serial Input

Serial input data bits are shift-in at this pin, the most significant bit first. SI information is read on the falling edge of SCLK. The input data consists of two parts, control bits followed by data bits. Please refer to **Chapter 9.5** for further information.

SO Serial Output

Data is shifted out serially at this pin, the most significant bit first. SO is in high impedance state until the CS pin goes to “low” state. New data will appear at the SO pin following the rising edge of SCLK.

Please refer to **Chapter 9.5** for further information.

9.2 Daisy Chain Capability

The SPI of BTS56033-LBB provides daisy chain capability. In this configuration several devices are activated by the same CS signal MCS. The SI line of one device is connected with the SO line of another device (see **Figure 28**), in order to build a chain. The end of the chain is connected to the output and input of the master device, MO and MI respectively. The master device provides the master clock MCLK which is connected to the SCLK line of each device in the chain.

Figure 28 Daisy Chain Configuration

In the SPI block of each device, there is one shift register where each bit from SI line is shifted in each SCLK. The bit shifted out occurs at the SO pin. After eight SCLK cycles, the data transfer for one device is finished. In single chip configuration, the CS line must turn “high” to make the device acknowledge the transferred data. In daisy chain configuration, the data shifted out at device 1 has been shifted in to device 2. When using three devices in daisy chain, three times 8 bits have to be shifted through the devices. After that, the MCS line must turn “high” (see **Figure 29**).

Serial Peripheral Interface (SPI)

9.5 SPI Protocol

The relationship between SI and SO content during SPI communication is shown in [Figure 31](#). SI line represents the frame sent from the μC and SO line is the answer provided by BTS56033-LBB. The “(previous response)” means that the frame sent back depends on the command frame sent from the μC before.

Figure 31 Relationship between SI and SO during SPI communication

The SPI protocol provides the answer to a command frame only with the next transmission triggered by the μC . Although the biggest majority of commands and frames implemented in BTS56033-LBB can be decoded without the knowledge of what happened before, it is advisable to consider what the μC sent in the previous transmission to decode BTS56033-LBB response frame completely.

More in detail, the sequence of commands to “read” and “write” the content of a register will look as follows:

Figure 32 Register content sent back to μC

There are 3 special situations where the frame sent back to the μC doesn't depend on the previous received frame:

- in case an error in transmission happened during the previous frame (for instance, the clock pulses were not multiple of 8), shown in [Figure 33](#)
- when BTS56033-LBB logic supply comes out of Power-On reset condition, as shown in [Figure 34](#)
- when $V_S < V_{SMON}$ and $\text{DCR.MUX} \neq 111_B$, as shown in [Figure 35](#)

Figure 33 BTS56033-LBB response after an error in transmission

Figure 34 BTS56033-LBB response after coming out of Power-On reset at V_{DD}

Figure 35 BTS56033-LBB response in case of a negative battery voltage transient

A summary of all possible SPI commands is presented in [Table 14](#), including the answer that BTS56033-LBB will send back at the next transmission.

Serial Peripheral Interface (SPI)

Table 14 SPI Command Summary

| Requested Operation | Frame sent to SPOC+ (SI pin) | Frame received from SPOC+ (SO pin) with the next command |
|------------------------------|---|---|
| Write OUT register | 10aaaaaa _B where: “aaaaaa _B ” = new OUT register content | 0aaaaaa _B (Standard Diagnosis) |
| Read OUT register | 00xx0000 _B (“xx _B ” = don't care) | 10aaaaaa _B (“aaaaaa _B ” = OUT register content) |
| Write Configuration register | 11aabbbb _B where: “aa _B ” = register address “bbbb _B ” = new register content | 0aaaaaa _B (Standard Diagnosis) |
| Read Configuration register | 01aa0000 _B where: “aa _B ” = register address | 11aabbbb _B where: “aa _B ” = register address “bbbb _B ” = register content |
| Read Standard Diagnosis | 0xxx0001 _B (“xxx _B ” = don't care) | 0aaaaaa _B (Standard Diagnosis) |
| Read Errors Diagnosis | 0xxx0011 _B (“xxx _B ” = don't care) | 00aaaaaa _B (Error Diagnosis) |

9.6 SPI Diagnosis Registers

9.6.1 Standard Diagnosis

| | | | | | | | | | |
|----|---|---|---|---|---|---|---|---|---------|
| SO | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | Default |
|----|---|---|---|---|---|---|---|---|---------|

| | | | | | | |
|---|-----|-----|-----|-------|---------|-----------------|
| 0 | TER | LHI | STB | VSMON | ERR_MUX | 50 _H |
|---|-----|-----|-----|-------|---------|-----------------|

| Field | Bits | Type | Description |
|---------|------|------|---|
| TER | 6 | r | Transmission Error 0 _B Previous transmission was successful (modulo 8 clocks received) 1 _B (default) Previous transmission failed or first transmission after reset |
| LHI | 5 | r | Limp Home monitor 0 _B (default) Normal mode operation 1 _B Limp Home Mode |
| STB | 4 | r | Standby mode monitor 0 _B Normal mode operation 1 _B (default) Stand-by mode |
| VSMON | 3 | r | V_S monitor 0 _B (default) V _S always > V _{SMON} since last Standard Diagnosis readout 1 _B V _S < V _{SMON} at least once |
| ERR_MUX | 2:0 | r | Diagnosis of Channel n in error 000 _B (default) No channel latched OFF 001 _B Channel one latched OFF 010 _B Channel two latched OFF 011 _B Channel three latched OFF 100 _B Channel four latched OFF 101 _B Channel five latched OFF 110 _B Channel six latched OFF 111 _B More than one channel latched OFF |

9.6.2 Errors Diagnosis

| | | | | | | | | | |
|----|---|---|--------------|---|---|---|---|---|-----------------|
| SO | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | Default |
| | 0 | 0 | ERR_COUNTERn | | | | | | 00 _H |

| Field | Bits | Type | Description |
|----------------------------|------|------|---|
| ERR_COUNTERn n = 6 to 1 | 5:0 | r | Diagnosis of Channel n 0 _B (default) No failure 1 _B Over temperature counter reached to n_{retry} |

9.6.3 Warnings Diagnosis

| | | | | | | | | | |
|----|---|---|------|---|---|---|---|---|-----------------|
| SO | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | Default |
| | 0 | 0 | ERRn | | | | | | 00 _H |

| Field | Bits | Type | Description |
|--------------------|------|------|---|
| ERRn n = 6 to 1 | 5:0 | r | Warning Diagnosis of Channel n 0 _B (default) No failure 1 _B Over temperature counter > 0 |

9.7 SPI Configuration Registers

The following table provides an overview on the registers available and the available addressing space.

Table 15 Register Overview

| Register name | Register Bank | Address | SWCR . SWR bit | Content |
|---------------|---------------|---------|----------------|------------------------------------|
| OUT | 0 | (na) | 0 | Output configuration |
| OUT | 0 | (na) | 1 | Input status |
| SWCR | 1 | 00 | (na) | Swap configuration |
| LGCR | 1 | 01 | 0 | LED mode configuration |
| LGCR | 1 | 01 | 1 | Gate Back Regulation configuration |
| HWCR | 1 | 10 | (na) | Hardware configuration |
| DCR | 1 | 11 | (na) | Diagnostic configuration |

9.7.1 Output Configuration Register

SWCR . SWR = 0

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
|------|--|----|------------|---|---|---|---|---|-----------------|
| Name | $\overline{W} = 1$ $\overline{R} = 0$ | RB | 5 | 4 | 3 | 2 | 1 | 0 | Default |
| OUT | W/R | 0 | OUT . OUTn | | | | | | 80 _H |

9.7.2 Input Status Register

SWCR . SWR = 1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
|------|--|----|-----|---|-------------|---|---|-----------------|---------|
| Name | $\overline{W} = 1$ $\overline{R} = 0$ | RB | 5 | 4 | 3 | 2 | 1 | 0 | Default |
| OUT | R | 0 | LHI | 1 | OUT . INSTn | | | 90 _H | |

9.7.3 Swap Configuration Register

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | Default |
|------|--|----|------|---|------------|---|---|---|-----------------|
| Name | $\overline{W} = 1$ $\overline{R} = 0$ | RB | ADDR | | 3 | 2 | 1 | 0 | |
| SWCR | W/R | 1 | 00 | | SWCR . SWR | 1 | 0 | 0 | C4 _H |

9.7.4 LED Mode Configuration Register

$SWCR.SWR = 0$

| Name | $\frac{W}{R} = 1$ $\frac{R}{W} = 0$ | RB | ADDR | 3 | 2 | 1 | 0 | Default |
|------|--|----|------|-----------|---|---|---|-----------------|
| LGCR | W/R | 1 | 01 | LGCR.LEDn | | | 0 | D0 _H |

9.7.5 Gate Back Regulation Register

$SWCR.SWR = 1$

| Name | $\frac{W}{R} = 1$ $\frac{R}{W} = 0$ | RB | ADDR | 3 | 2 | 1 | 0 | Default |
|------|--|----|------|-----------|---|---|---|-----------------|
| LGCR | W/R | 1 | 01 | LGCR.GBRn | | | 0 | DE _H |

9.7.6 Hardware Configuration Register

| Name | $\frac{W}{R} = 1$ $\frac{R}{W} = 0$ | RB | ADDR | 3 | 2 | 1 | 0 | Default |
|------|--|----|------|----------|----------|----------|----------|-----------------|
| HWCR | R | 1 | 10 | HWCR.RCR | HWCR.COL | HWCR.STB | 0 | E2 _H |
| | W | 1 | 10 | HWCR.RCR | HWCR.COL | HWCR.RST | HWCR.CTC | - |

9.7.7 Diagnosis Control Register

| Name | W = 1 R = 0 | RB | ADDR | 3 | 2 | 1 | 0 | Default |
|------|----------------|----|------|---------|---------|---|---|-----------------|
| DCR | R | 1 | 11 | DCR.SBM | DCR.MUX | | | F7 _H |
| | W | 1 | 11 | 0 | DCR.MUX | | | - |

9.7.8 Configuration Register Bit Overview

| Field | Bits | Type | Description |
|-------------------------|------|------|---|
| RB | 6 | rw | Register Bank 0 _B (default) Read / write to OUT register 1 _B Read / write to other registers |
| OUT.OUTn n = 6 to 1 | 5:0 | rw | Output Control Register of Channel n 0 _B (default) channel is OFF 1 _B Channel is ON |
| OUT.INSTn n = 4 to 1 | 3:0 | r | Input Status Monitor Channel n 0 _B (default) Input signal is "low" 1 _B Input signal is "high" |
| LGCR.LEDn n = 4 to 2 | 3:1 | rw | Set LED Mode for Channel n 0 _B (default) Channel n is in bulb mode 1 _B Channel n is in LED mode |
| LGCR.GBRn n = 4 to 2 | 3:1 | rw | Gate Back Regulation for Channel n 0 _B Gate back regulation for Channel n is forced OFF 1 _B (default) Gate back regulation for Channel n is active |
| HWCR.CTC | 0 | w | Clear Thermal Counter 0 _B (default) Thermal latches are untouched 1 _B Command: Clear all thermal latches |
| HWCR.RST | 1 | w | Reset Command 0 _B (default) Normal operation 1 _B Execute reset command |
| HWCR.STB | 1 | r | Standby Mode 0 _B Device is awake 1 _B (default) Device is in Standby mode |
| HWCR.COL | 2 | rw | Input Combinatorial Logic Configuration 0 _B (default) Input signal OR-combined with according OUT register bit ¹⁾ 1 _B Input signal AND-combined with according OUT register bit |
| HWCR.RCR | 3 | rw | Retry Counter Reset 0 _B (default) Retry Counter is reset only for HWCR.CTC =1 (and V_{DD} reset) 1 _B Retry Counter is reset for every IN-pin or OUT.OUTn "high" to "low" transition for $n_{\text{retry}} < n_{\text{retry,max}}$ and also for HWCR.CTC =1 (and V_{DD} reset) |

Serial Peripheral Interface (SPI)

| Field | Bits | Type | Description |
|----------|------|------|---|
| SWCR.SWR | 1 | rw | Switch Register 0 _B (default) OUT.OUTn and LGCR.LEDn can be written and read 1 _B OUT.INSTn can be read and LGCR.GBRn can be written and read |
| DCR.SBM | 3 | r | Switch Bypass Monitor²⁾ 0 _B $V_{DS} < V_{DS(SB)}$ 1 _B $V_{DS} > V_{DS(SB)}$ |
| DCR.MUX | 2:0 | rw | Set Current Sense Multiplexer Configuration in OFF-state 000 _B IS pin is high impedance 001 _B IS pin is high impedance 010 _B IS pin is high impedance 011 _B IS pin is high impedance 100 _B IS pin is high impedance 101 _B IS pin is high impedance 110 _B IS pin is high impedance 111 _B Stand-by mode (IS pin is high impedance) Set Multiplexer Configuration in ON-state 000 _B Current sense of channel 1 is routed to IS pin 001 _B Current sense of channel 2 is routed to IS pin 010 _B Current sense of channel 3 is routed to IS pin 011 _B Current sense of channel 4 is routed to IS pin 100 _B Current sense of channel 5 is routed to IS pin 101 _B Current sense of channel 6 is routed to IS pin 110 _B IS pin is high impedance 111 _B Stand-by mode (IS pin is high impedance) |

1) In Limp Home Mode (LHI pin set to "high") the combinatorial logic is switched to OR-mode.

2) The switch bypass monitor compares the threshold $V_{DS(SB)}$ with the voltage V_{DS} across the power transistor of that channel which is selected by the current sense multiplexer (**DCR.MUX**).

10 Application Description

The following figure describes a typical operating circuit. It shall not be considered as a warranty of a certain functionality, condition or quality of the device. The [Table 16](#) shows suggested component values and purposes.

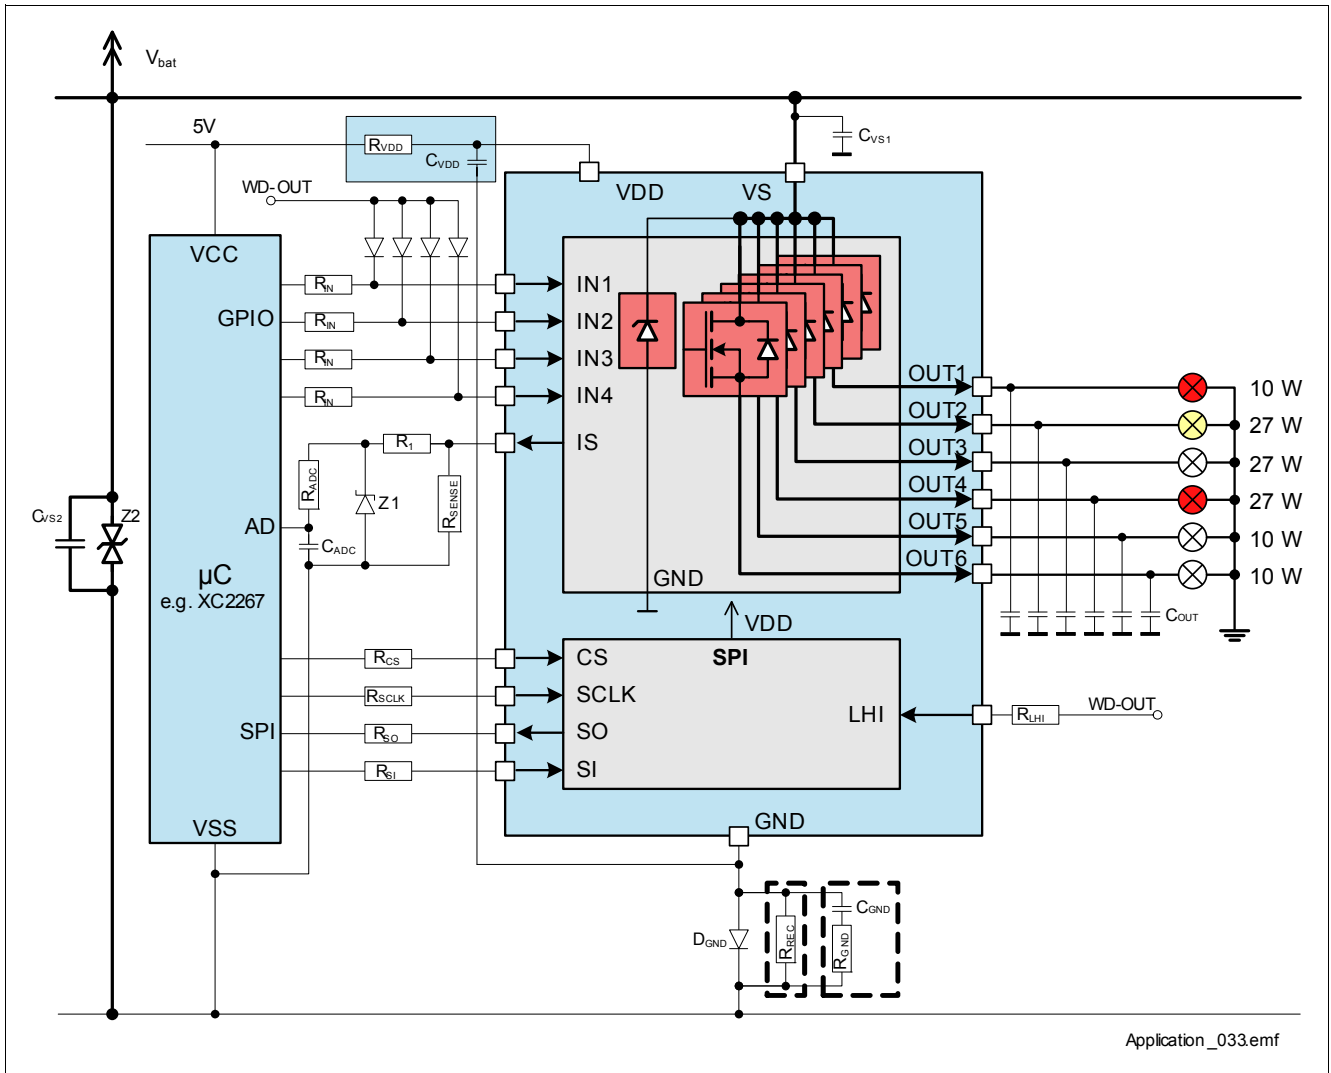

Figure 36 Application Circuit Example

Table 16 Suggested Component Values

| Reference | Value | Purpose |
|------------|----------------|--|
| R_{VDD} | 500 Ω | Device logic protection (Size 1206 recommended) |
| R_{IN} | 8 k Ω | Protection of the μ C during overvoltage, reverse polarity and loss of ground |
| R_1 | 4.7 k Ω | Protection resistor for overvoltage, reverse polarity and loss of ground. Value to be tuned with μ C specification |
| R_{IS} | 2.7 k Ω | Sense resistor |
| R_{ADC} | 1 k Ω | μ C-ADC voltage spikes filtering |
| R_{CS} | 3.9 k Ω | Protection of the μ C during overvoltage and reverse polarity |
| R_{SCLK} | 3.9 k Ω | Protection of the μ C during overvoltage and reverse polarity |
| R_{SO} | 3.9 k Ω | Protection of the μ C during overvoltage and reverse polarity |
| R_{SI} | 3.9 k Ω | Protection of the μ C during overvoltage and reverse polarity |
| R_{LHI} | 8 k Ω | Protection of the μ C during overvoltage and reverse polarity |
| C_{ADC} | 1 nF | μ C-ADC voltage spikes filtering |
| C_{VDD} | 100 nF | Logic supply voltage spikes filtering |
| C_{VS1} | 68 nF | Battery voltage spikes filtering |
| C_{VS2} | 100 nF | Battery voltage spikes filtering |
| C_{OUT} | 10 nF | For improved electromagnetic compatibility (EMC) |
| C_{GND} | 8.2 nF | Ground voltage spikes filtering (optional for improved robustness against battery voltage transients) |
| R_{GND} | 100 Ω | Ground voltage spikes filtering (optional for improved robustness against battery voltage transients) |
| R_{REC} | 1 k Ω | Ground voltage recycling path (optional for providing a recycle path in case of loss of Battery) |
| Z_1 | 7 V | Protection of μ C during overvoltage. Zener diode |
| Z_2 | P6SMB30 | Protection of device during overvoltage. Zener diode |
| D_{GND} | BAS70 | Protection of device during reverse polarity. Schottky diode |

Green Product (RoHS Compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e. Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

Note: You can find all of our packages, sorts of packing and others in our Infineon Internet Page "Products": <http://www.infineon.com/products>.

Legal Disclaimer

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

Legal Disclaimer for short-circuit capability

Infineon disclaims any warranties and liabilities, whether expressed nor implied, for any short-circuit failures below the threshold limit.

Information

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office (www.infineon.com).

Warnings

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
