DESCRIPTION

The CDCVF2505 is a high-performance, low-skew, low-jitter, phase-lock loop (PLL) clock driver. It uses a PLL to precisely align, in both frequency and phase, the output clocks (1Y[0–3] and CLKOUT) to the input clock signal (CLKIN). The CDCVF2505 operates at 3.3 V. It also provides integrated series-damping resistors that make it ideal for driving point-to-point loads.

One bank of five outputs provides low-skew, low-jitter copies of CLKIN. Output duty cycles are adjusted to 50 percent, independent of duty cycle at CLKIN. The device automatically goes in power-down mode when no input signal is applied to CLKIN.

Unlike many products containing PLLs, the CDCVF2505 does not require an external RC network. The loop filter for the PLLs is included on-chip, minimizing component count, space, and cost.

Because it is based on the PLL circuitry, the CDCVF2505 requires a stabilization time to achieve phase lock of the feedback signal to the reference signal. This stabilization is required following power up and application of a fixed-frequency, fixed-phase signal at CLKIN, and following any changes to the PLL reference.

The CDCVF2505 is characterized for operation from -40°C to 85°C .

FUNCTION TABLE

INPUT	OUTPUTS	
CLKIN	1Y[0–3]	CLKOUT
L	L	L
H	H	H
<10 MHz ⁽¹⁾	Z	Z

(1) Below 2 MHz (typical) the device goes into power-down mode, during which the PLL is turned off and the outputs enter into Hi-Z mode. If a >10-MHz signal is applied at CLKIN, the PLL turns on, reacquires lock, and stabilizes after approximately 100 μs. The outputs are then enabled.

TERMINAL FUNCTIONS

NAME	NO.	I/O	DESCRIPTION
1Y0	3	O	Clock outputs. These outputs are low-skew copies of CLKIN. Each output has an integrated 25-Ω series damping resistor.
1Y1	2		
1Y2	5		
1Y3	7		
CLKIN	1	I	Clock input. CLKIN provides the clock signal to be distributed by the CDCVF2505 clock driver. CLKIN is used to provide the reference signal to the integrated PLL that generates the clock output signals. CLKIN must have a fixed frequency and fixed phase for the PLL to obtain phase lock. Once the circuit is powered up and a valid signal is applied, a stabilization time (100 μs) is required for the PLL to phase lock the feedback signal to CLKIN.
CLKOUT	8	O	Feedback output. CLKOUT completes the internal feedback loop of the PLL. This connection is made inside the chip and an external feedback loop should NOT be connected. CLKOUT can be loaded with a capacitor to achieve zero delay between CLKIN and the Y outputs.
