## MAX1856 Evaluation Kit SLIC Power Supply

**Evaluates: MAX1856**

### General Description

The MAX1856 evaluation kit (EV kit) is a fully assembled and tested surface-mount circuit board that contains an inverting transformer flyback DC-DC converter. The circuit is configured for two output voltages simultaneously: a -72V that can supply up to 100mA and a -24V that can supply up to 400mA. The input voltage may range from +8V to +24V. The circuit can be configured for -48V, and supply up to 200mA. When operating from a +5V input supply, the circuit can deliver up to 7.2W output power in either configuration.

The MAX1856 EV kit switching frequency is set at 250kHz but can range from 100kHz to 500kHz or may be driven by an external clock. The MAX1856 EV kit demonstrates low quiescent current and high efficiency (over 80%). The MAX1856 comes in the 10-pin  $\mu$ MAX package.

### Features

- ◆ +8V to +24V Input Range
- ◆ +5V Input Range at Up to 7.2W Output Power
- ◆ Output Voltages
  - VOUT1 = -72V at 100mA
  - VOUT2 = -24V at 400mA
- ◆ Configurable for -48V at 200mA Output
- ◆ 100kHz to 500kHz Switching Frequency
- ◆ External Frequency Control
- ◆ Low-Cost Minimum Components with Flyback Design
- ◆ Fully Assembled and Tested

### Ordering Information

PART	TEMP RANGE	IC PACKAGE
MAX1856EVKIT	0°C to +70°C	10 $\mu$ MAX

### Component List

DESIGNATION	QTY	DESCRIPTION
C1	1	22 $\mu$ F, 100V aluminum electrolytic capacitor (8 x 11.5) Sanyo 100MV22AX
C2	1	100 $\mu$ F, 35V aluminum electrolytic capacitor (8 x 11.5) Sanyo 35MV100AX
C3, C4	2	10 $\mu$ F $\pm$ 10%, 25V X5R ceramic capacitors (1812) Taiyo Yuden TMK432BJ106KM
C5	1	100pF $\pm$ 10%, 200V COG ceramic capacitor (0805) Murata GRM40COG101K200
C6, C7	0	Not installed
C8	1	470pF $\pm$ 10%, 200V X7R ceramic capacitor (0805) Murata GRM40X7R471K200
C9	1	1 $\mu$ F $\pm$ 10%, 25V X7R ceramic capacitor (1206) Taiyo Yuden TMK316BJ105KL

**Note:** Please indicate that you are using the MAX1856 when contacting these component suppliers.

## Quick Start

The MAX1856 EV kit is fully assembled and tested. Follow these steps to verify board operation. **Do not turn on the power supply until all connections are completed:**

### Output VOUT1 and VOUT2

- 1) Verify that a shunt is across pins 1 and 2 of jumper JU1 (SYNC/SHDN).
- 2) Connect a voltmeter to the VOUT1 pad.
- 3) Connect a +8V to +24V DC power supply to the VIN pad, with the voltage set to 0.
- 4) Connect the supply ground to the GND pad.
- 5) Turn on the power supply and gradually increase the input voltage through the +8V to +24V range.
- 6) Verify that VOUT1 is -72V throughout the +8V to +24V input voltage range.
- 7) Verify that VOUT2 is -24V throughout the +8V to +24V input voltage range.

**Note:** Exercise caution when measuring the -72V.

For instructions on reconfiguring VOUT1 to -48V, see *Evaluating -48V Output*.

## Detailed Description

The MAX1856 EV kit is an inverted flyback DC-DC converter configured for two output voltages simultaneously. The transformer has a 1:2:2:2 turns ratio. The secondary has three taps to provide three different ratios of 1:2, 1:4, and 1:6. VOUT1 is connected to the 1:6 tap, providing -72V, which can supply up to 100mA. VOUT2 is connected to the 1:2 tap, providing -24V, which can supply up to 400mA. VOUT1 may be connected to the 1:4 tap to provide -48V and supply up to 200mA. The input voltage can range from +8V to +24V. The output voltage is determined by the following equation:

$$|V_{OUT}| = V_{IN} \times (N_2 / N_1) \times D / (1 - D)$$

where  $(N_2 / N_1)$  is the secondary/primary turns ratio of the transformer, and  $D$  is the duty cycle of the pulse-width-modulating (PWM) switching signal.

For a fixed turns ratio, the duty cycle ( $D$ ), will vary to compensate for the variation in  $V_{IN}$  to maintain a constant output voltage.

For example, for  $(N_2 / N_1) = 6:1$ , as  $V_{IN}$  varies from +8V to +24V,  $D$  will vary from 60% to 33% to keep  $V_{OUT}$  constant at -72V.

# MAX1856 Evaluation Kit SLIC Power Supply

Evaluates: MAX1856

When the input voltage drops to +5V, the total output power will fall to about 7.2W.

The MAX1856 EV kit switches at 250kHz but can be varied from 100kHz to 500kHz by the internal oscillator in combination with resistor R8 (R<sub>OSC</sub>). The operating frequency may also be controlled by an external clock at the SYNC/SHDN pad. The external source must be a TTL level, and its maximum duty cycle may not exceed 45% for the 100kHz to 500kHz frequency range.

## Jumper Selection

### Shutdown Mode

The MAX1856 EV kit features a shutdown mode that reduces the MAX1856 quiescent current. The 2-pin jumper (JU1) selects the shutdown mode for the MAX1856. Table 1 lists the selectable jumper options.

### Sync Mode

The MAX1856 EV kit features a synchronous mode that enables the operating frequency to be controlled by an external clock. To utilize the sync mode, remove the shunt on jumper JU1, and connect an external frequency source to the SYNC/SHDN pad. Select R8 as:

$$R_8(R_{OSC}) = \frac{1.15 \times 50M\Omega \times \text{kHz}}{f_{CLOCK}(\text{kHz})}$$

The external frequency source must be a TTL level and have a 20% to 45% duty cycle.

**Table 1. Jumper JU1 Functions**

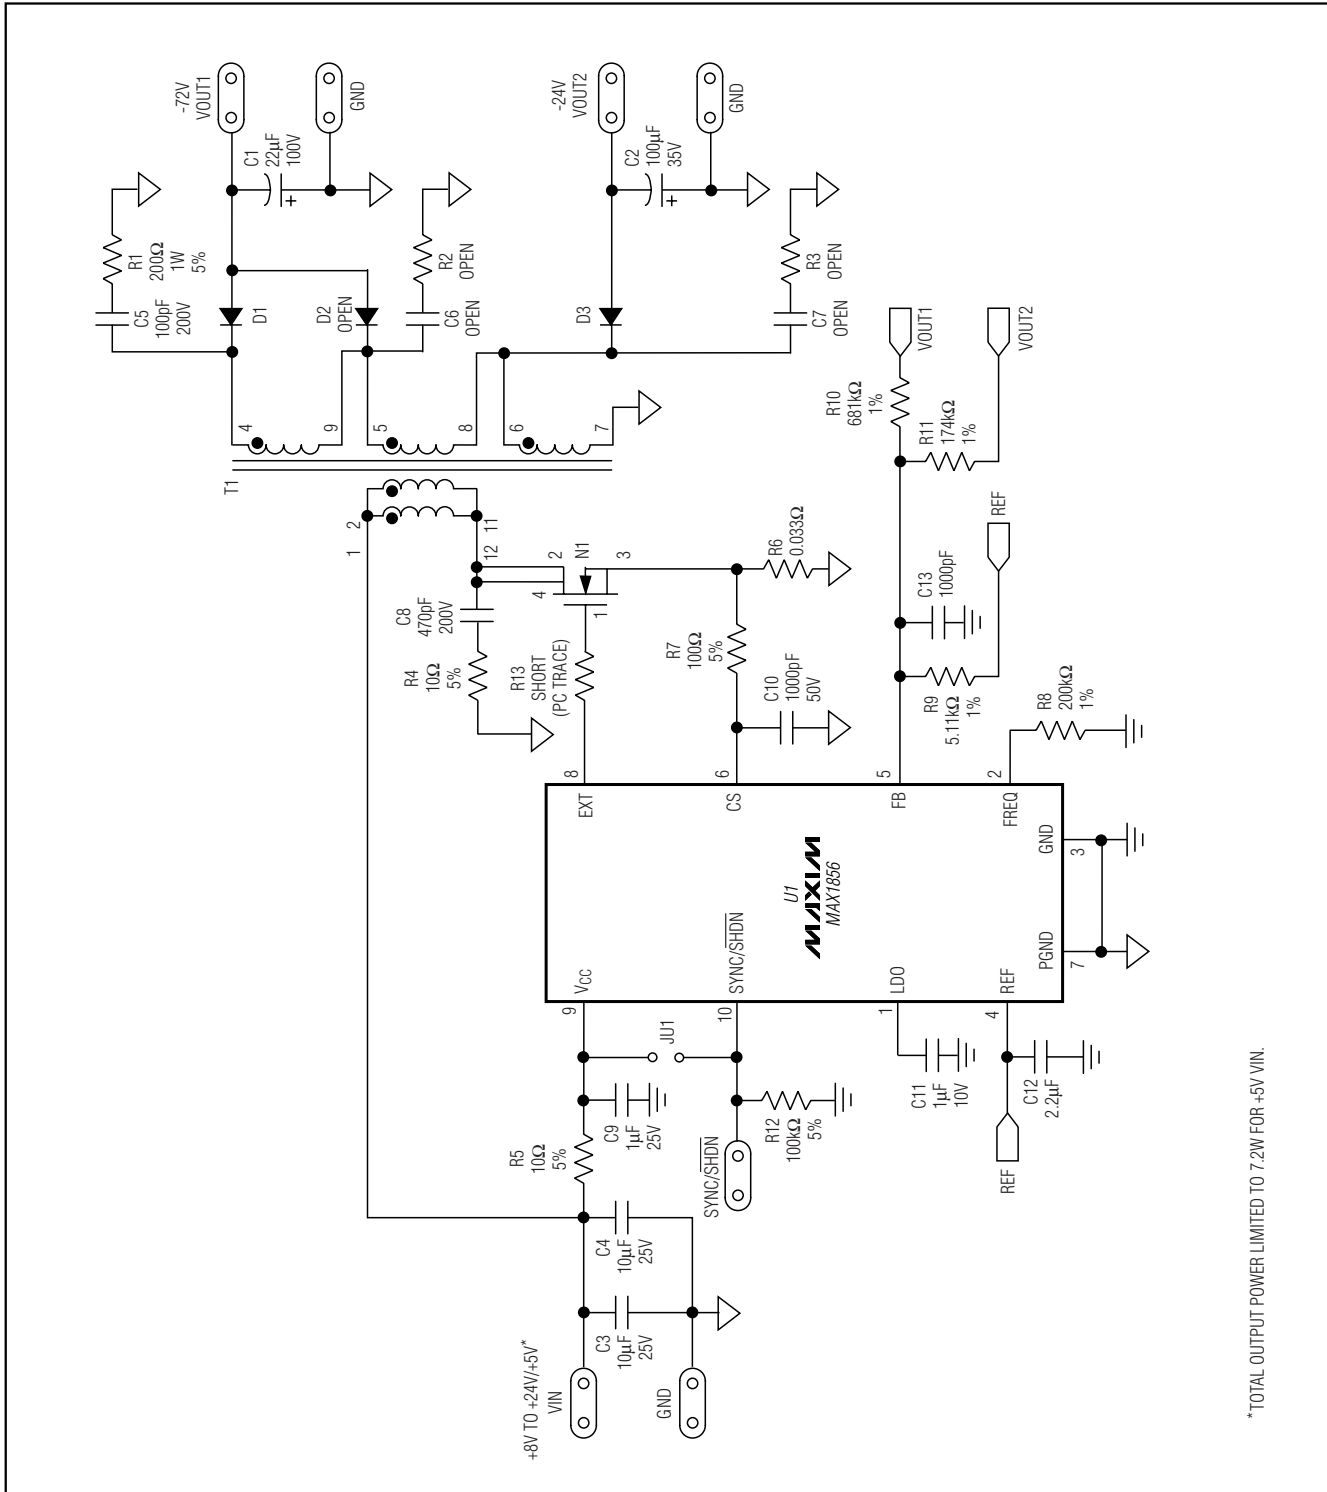

SHUNT LOCATION	SYNC/SHDN PIN	MAX1856 OUTPUT
1-2	Connected to VIN	MAX1856 enabled, VOUT1 = -72V, VOUT2 = -24V
None	No external frequency source connected to SYNC/SHDN pad	Shutdown mode, VOUT1 = VOUT2 = 0
None	External frequency source* connected to SYNC/SHDN pad	MAX1856 enabled, VOUT1 = -72V, VOUT2 = -24V

\*External frequency source must have a duty cycle within the 20% to 45% range.

## Evaluating -48V Output

The MAX1856 EV kit's -72V (VOUT1) output may be reconfigured for -48V and supply up to 200mA of current. To configure the -72V (VOUT1) output to -48V, remove diode D1 and install diode D2 (Central Semiconductor CMR1U-02 recommended). Remove capacitor C5 and install capacitor C6 (100pF, 200V). Remove resistor R1 and install resistor R2 (470Ω, 0.5W). Replace resistor R10 with a 196kΩ ±1%, surface-mount (0805) resistor. Remove D3 and R11.
