## Graphic Display Module

### Part Number

G12832A-UW-DW63

### Overview

Custom UWVD LCD with FPC: 128x32  
(30x11.5), Transmissive (negative), Bottom  
Viewing Angle (6:00), 1/33 Duty, 1/7 Bias, 3.3V  
LCD, 3.0V White LED Backlight, Operating  
Temp: -20C to +70C, Storage Temp: -30C to  
+80C, 105mm FPC, COG Controller: ST7539I

## 1. Features

<b>Item</b>	<b>Contents</b>	<b>Unit</b>
LCD type	VATN, Negative, Transmissive	---
LCD duty	1/33	---
LCD bias	1/7	---
VDD	3.3	V
Vop	9.0	V
Viewing direction	6:00	o'clock
Module size (W×H×T)	30.0×11.5×3.5	mm
Viewing area	23.98×7.58	mm
Active area	22.38×5.58	mm
Number of dots(W×H)	128×32	dots
LCD type	COG	
IC	ST7539I	
Backlight type	LED/White/3.0V/15mA	

All Pages Of This Edition Approved

### 4. LED backlight

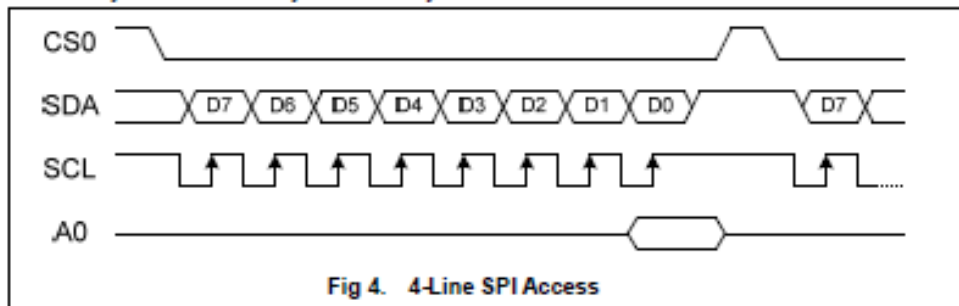

## 5. Timing characteristics

### 4-Line Serial interface

ST7539 is active when CS0 is "L" and CS1 is "H", serial data (SDA) and serial clock (SCL) inputs are enabled. When CS0 and CS1 are "H", ST7539 is not active, and the internal 8-bit shift register and 3-bit counter are reset. Some specified information (status byte) can be read out in this mode. The DDRAM column address pointer will be increased by one automatically after writing each byte of DDRAM.

The display data/command indication is controlled by the register selection pin (A0). The signals transferred on data bus will be display data when A0 is high and will be instruction when A0 is low. Serial data (SDA) is latched at the rising edge of serial clock (SCL). After the 8<sup>th</sup> serial clock, the serial data will be processed as 8-bit parallel data. The DDRAM column address pointer will be increased by one automatically after each byte of DDRAM access.

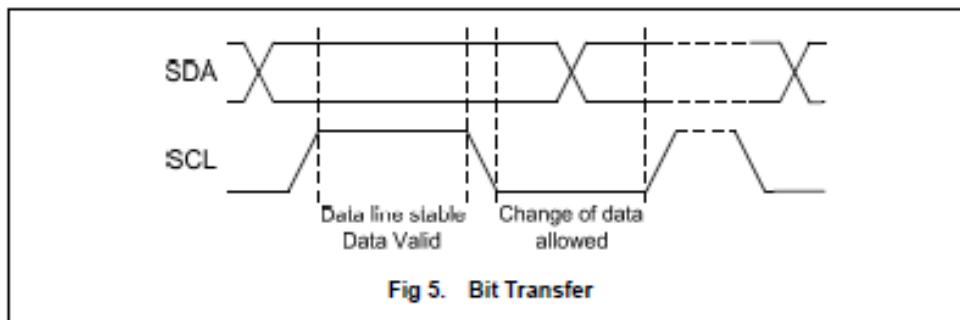

### I<sup>2</sup>C Interface

The I<sup>2</sup>C Interface is for bi-directional, two-line communication between different ICs or modules. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected with a pull-up resistor which drives SDA and SCL to high when the bus is not busy. Data transfer can be initiated only when the bus is not busy.

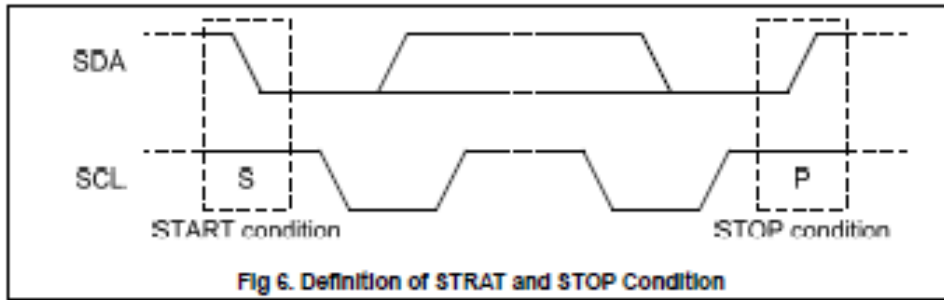

#### BIT TRANSFER

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse because changes of SDA line at this time will be interpreted as START or STOP. Bit transfer is illustrated in Fig 5.

#### START AND STOP CONDITIONS

Both SDA and SCL lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of SDA, while SCL is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of SDA while SCL is HIGH is defined as the STOP condition (P). The START and STOP conditions are illustrated in Fig 6.

**SYSTEM CONFIGURATION**

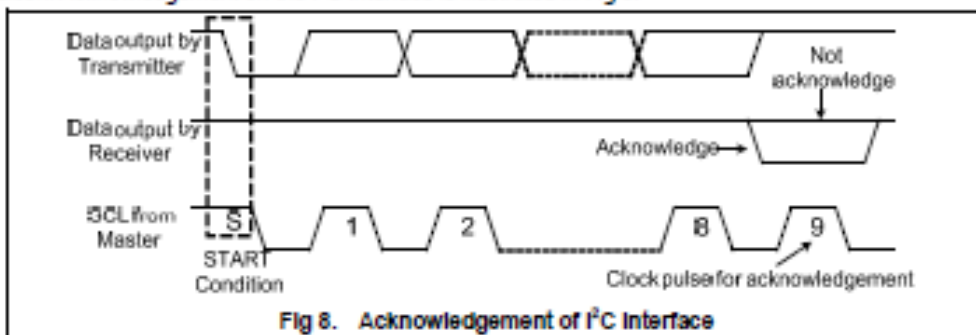

The system configuration is illustrated in Fig 7. and some word-definitions are explained below:

- Transmitter: the device which sends the data to the bus.
- Receiver: the device which receives the data from the bus.
- Master: the device which initiates a transfer, generates clock signals and terminates a transfer.
- Slave: the device which is addressed by a master.
- Multi-Master: more than one master can attempt to control the bus at the same time without corrupting the message.
- Arbitration: the procedure to ensure that, if more than one master tries to control the bus simultaneously, only one is allowed to do so and the message is not corrupted.
- Synchronization: procedure to synchronize the clock signals of two or more devices.

**ACKNOWLEDGEMENT**

Each byte of eight bits is followed by an acknowledge-bit. The acknowledge-bit is a HIGH signal put on SDA by the transmitter during the time when the master generates an extra acknowledge-related clock pulse. A slave receiver which is addressed must generate an acknowledge-bit after the reception of each byte. A master receiver must also generate an acknowledge-bit after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull-down the SDA line during the acknowledge-clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge-related clock pulse (set-up and hold times must be taken into consideration). A master receiver must signal an end-of-data to the slave transmitter by not generating an acknowledge-bit on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a STOP condition. Acknowledgement on the I<sup>2</sup>C Interface is illustrated in Fig 8.

## I<sup>2</sup>C INTERFACE PROTOCOL

ST7539 supports command/data write to addressed slaves on the bus.

Before any data is transmitted on the I<sup>2</sup>C Interface, the device, which should respond, is addressed first. Four 8-bit slave addresses (011100, 011101, 011110 and 011111) and A0 (0111000 or 0111001) are reserved for ST7539. The bit 2 and bit 1 are slave address that set by connecting SA0 and SA1 to either logic 0 (VSS1) or logic 1 (VDD1). The I<sup>2</sup>C Interface protocol is illustrated in Fig 9.

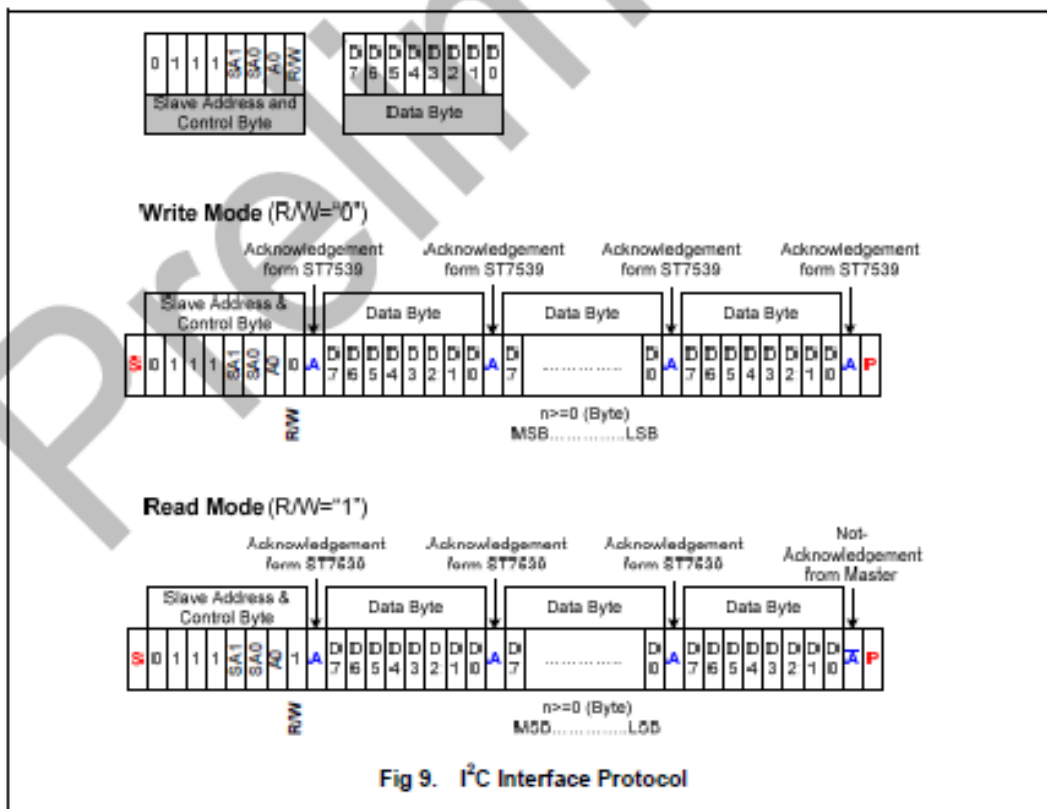

The sequence is initiated with a START condition (S) from the I<sup>2</sup>C Interface master, which is followed by the slave address and A0. All slaves with the corresponding address acknowledge in parallel, all the others will ignore the I<sup>2</sup>C Interface transfer. After acknowledgement, one or more command or data words are followed and define the status of the addressed slaves.

The slave address and control byte is tagged with a cleared most significant bit. The state of the A0 bit defines whether the following data bytes are interpreted as commands or as RAM data. All addressed slaves on the bus also acknowledge the control and data bytes. After the last control byte either a series of display data bytes or command data bytes may follow (depending on the A0 bit setting).

If the A0 bit of the last control byte is set to logic 1, these data bytes (display data bytes) will be stored in the display RAM at the address specified by the internal data pointer. The data pointer is automatically updated and the data is directed to the intended ST7539 device.

If the A0 bit of the last control byte is set to logic 0, these data bytes (command data byte) will be decoded and the setting of ST7539 will be changed according to the received commands.

Only the addressed slave makes the acknowledgement after each byte. At the end of the transmission the bus master issues a STOP condition (P). If no acknowledge is generated by the master after a byte, the driver stops transferring data to the master.

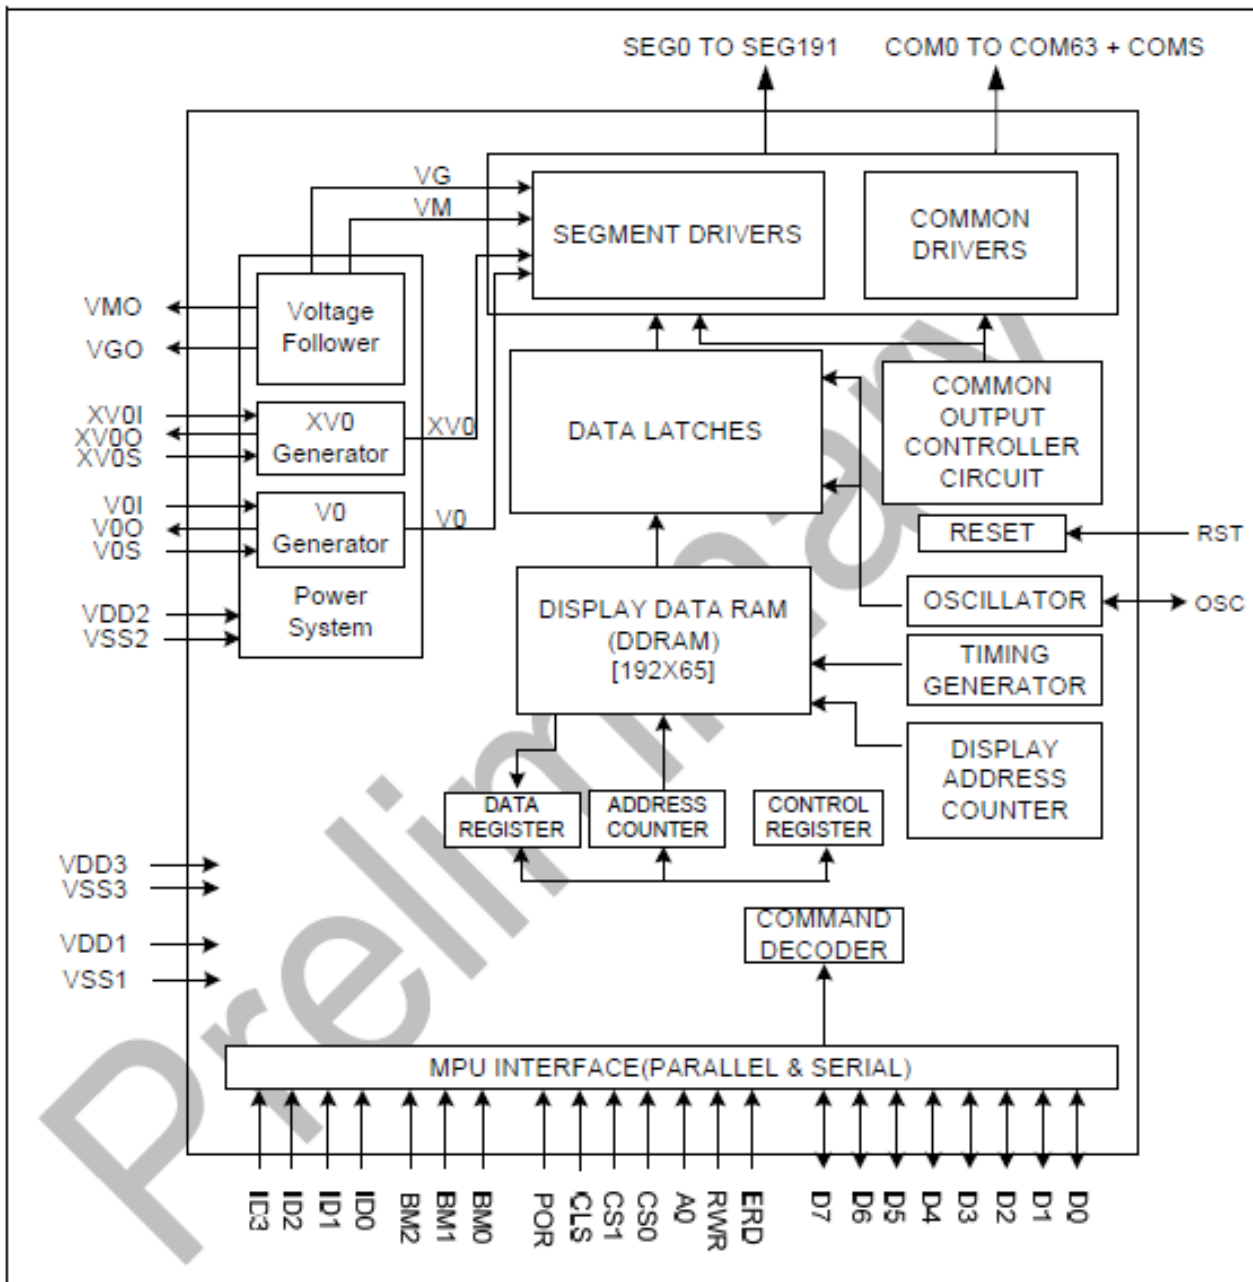

## 6. Pin define

<b>PIN</b>	<b>SYMBOL</b>	<b>FUNCTIONS</b>
1	VG	LCD driving voltage for segments
2	XV0	LCD driving voltage for commons at positive frame
3	V0	LCD driving voltage for commons at negative frame
4	VSS	Ground
5	VDD	Power supply
6	BM2	BM2,BM0 IS "L", 4-line serial interface BM2,BM0 IS "H", I2C serial interface
7	BM0	
8	SDA	Serial data input
9	SCL	Serial clock input
10	A0	Select for command or data
11	RST	Reset input pin
12	CS0	Chip select pin and slave address pin(i2c)
13	BLA	Backlight power
14	BLK	Backlight ground

## 7. Block diagram

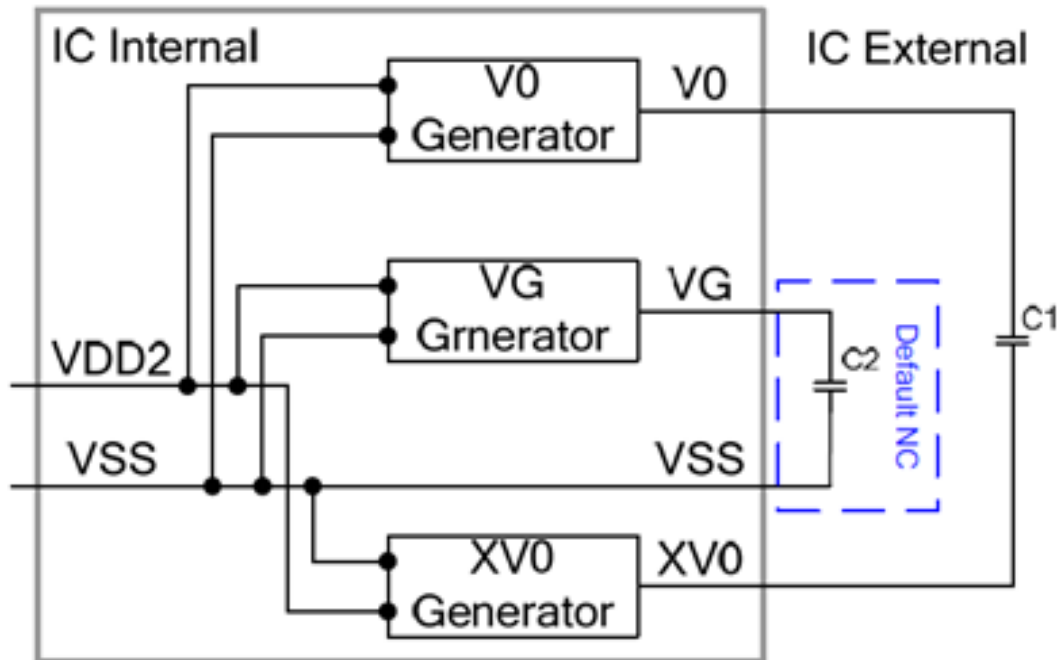

## 8. Instructions

COMMAND TABLE												
INSTRUCTION	A0	R/W (RWR)	COMMAND BYTE								DESCRIPTION	
			D7	D6	D5	D4	D3	D2	D1	D0

Test Control	0	0	1	1	1	1	1	1	1	1	Set test command table	
			--	--	--	--	--	--	H1	H0		

Note: 1. Do not use instructions not listed in these tables (Command Table).

2. "--" = Disabled bit. It can be either logic 0 or 1.

## 9. Booster application

The referential external component values are listed below.

1. C1=0.1uF~2.2uF (Non-Polar/25V, default 1uF)
2. C2=0.1uF~2.2uF (Non-Polar/6.3V, default N.C.)

## 10. Environmental absolute Maximum ratings

ITEM	SYMBOL	CONDITIONS	CRITERION
OPERATING TEMPERATURE	TOPR	-20°C ~ +70°C	NO DEFECT IN DISPLAYING AND OPERATIONAL FUNCTION
STORAGE TEMPERATURE	TSTG	-30°C ~ +80°C	NO DEFECT IN DISPLAYING AND OPERATIONAL FUNCTION

## 11. Reliability

ITEM	CONDITIONS	CRITERION
OPERATING TEMPERATURE	HIGH TEMPERATURE +70°C 96HRS	NO DEFECT IN DISPLAYING AND OPERATIONAL FUNCTION
	LOW TEMPERATURE -20°C 96HRS	
STORAGE TEMPERATURE	HIGH TEMPERATURE +80°C 96HRS	NO DEFECT IN DISPLAYING AND OPERATIONAL FUNCTION
	LOW TEMPERATURE - 30°C 96HRS	
HUMIDITY	40°C 90%RH 96HRS	NO DEFECT IN DISPLAYING AND OPERATIONAL FUNCTION
VIBRATION	<ul style="list-style-type: none"> <li>· Operating Time: thirty minutes exposure for each direction (X,Y,Z)</li> <li>· Sweep Frequency: 10 ~ 55Hz (1 min)</li> <li>· Amplitude: 1.5mm</li> </ul>	NO DEFECT IN DISPLAYING AND OPERATIONAL FUNCTION
THERMAL SHOCK	-20°C(30mins) ←→+70°C(30mins) 10 cycles	NO DEFECT IN DISPLAYING AND OPERATIONAL FUNCTION

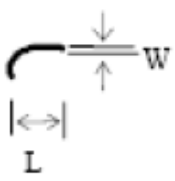

\*NOTE: TEST CONDITION

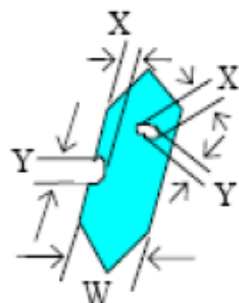

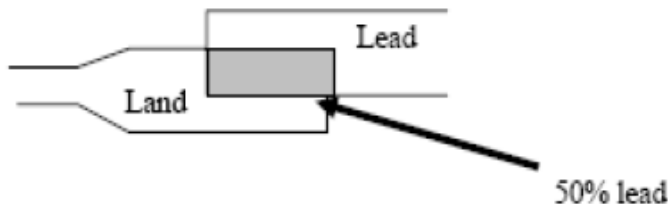

(1)TEMPERATURE AND HUMIDITY: IF NO SPECIFICATION, TEMP. SET AT 25±2°C, HUMIDITY SET AT 60±5%RH

(2) OPERATING STATE: SAMPLES SUBJECT TO THE TESTS SHALL BE IN " OPERATING" CONDITION

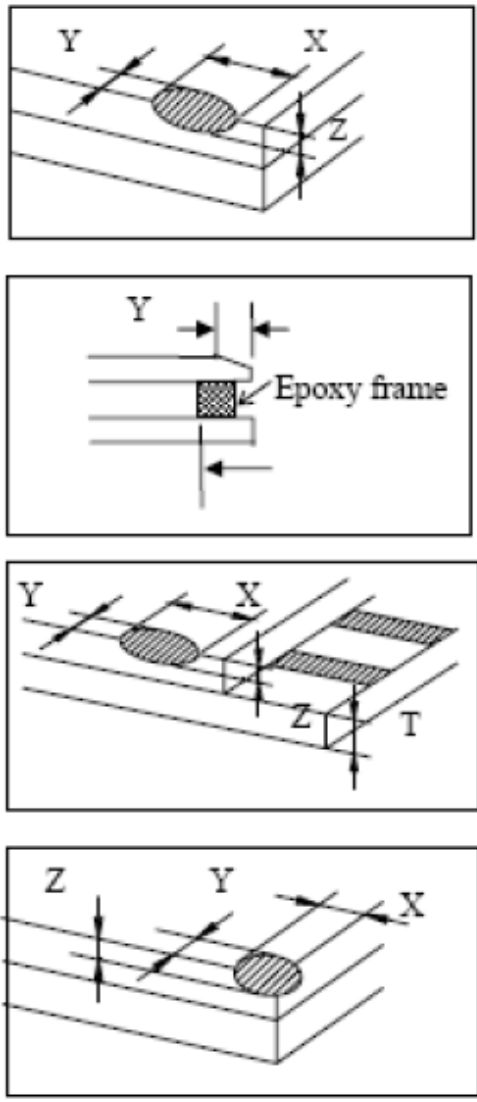

## 12. Inspection standard of LCM

Classify	Item		Note	AQL
Major	Display state	Short or open circuit	1	0.65
		Contrast defect (dim, ghost)		
		LC leakage		
		Flickering		
		No display		
		Wrong viewing direction	2	
		Wrong Back-light	7	
	Non-display	Flat cable or pin reverse	9	
Wrong or missing component		10		
Minor	Display state	Background color deviation	2	1.5
		Black spot and dust	3	
		Line defect	4	
		Scratch		
		Rainbow	5	
		Pin hole	6	
	Polarizer	Bubble and foreign material	3	
		Scratch	4

11

LCD

### 2.2 Chip out

- 1) Chip out is that crackles extend to inner edge .
- 2) Crackles round epoxy frame will be rejected.
- 3) Chip out on the terminal will be rejected:  $Z=T$  length  $>1\text{mm}$   
or  $Z<T$  length  $>2\text{mm}$
- 4) The chip out at ITO will be rejected.

### 2.3 Poor cutting

X	Y	Z
$>1/8A$	$\leq 0.3$	$\leq 1/2T$
$\leq 1/8A$	According to drawing	$1/2T \leq Z \leq T$

Any one out of the specification will be rejected.

## 13. Using LCD modules

### (1) Mounting Method

The panel of the LCD Module consists of two thin glass plates with polarizer' which easily get damaged since the Module is fixed by utilizing fitting holes in the printed circuit board. Extreme care should be taken when handling the LCD Modules.

### (2) Caution of LCD handling & cleaning

When cleaning the display surface, use soft cloth with solvent (recommended below) and wipe lightly.

- Isopropyl alcohol
- Ethyl alcohol
- Tricolor trifler thane

Do not wipe the display surface with dry or hard materials that will damage the polarizer surface.

Do not use the following solvent:

- Water
- Kenton
- Aromatics

### (3) Caution against static charge

The LCD Module use C-MOS LSI drivers, so we recommend that you connect any unused input terminal to VDD or VSS, do not input any signals before power is turned on. And ground your body, Work/assembly table. And assembly equipment to protect against static electricity.

### (4) Packaging

- Modules use LCD elements, and must be treated as such. Avoid intense shock and falls from a height.
- To prevent modules from degradation. Do not operate or store them exposed directly to sunshine or high temperature/humidity.

### (5) Caution for operation

- It is indispensable to drive LCD's within the specified voltage limit since the higher voltage than the limits shorten LCD life. An electrochemical reaction due to direct current causes LCD deterioration, Avoid the use of direct current drive.
- Response time will be extremely delayed at lower temperature than the operating temperature range and on the other hand at higher temperature LCD' s show dark color in them. However those phenomena do not mean malfunction or out of order with LCD' s , Which will come back in the specified operating temperature range.
- If the display area is pushed hard during operation, some font will be abnormally displayed but it resumes normal condition after turning off once.

- A slight dew depositing on terminals is a cause for electro-chemical reaction resulting in terminal open circuit.

Usage under the relative condition of 40 °C, 50%RH or less is required.

#### (6) Storage

In the case of storing for a long period of time (for instance.) For years) for the purpose or replacement use, the following ways are recommended.

- Storage in a polyethylene bag with sealed so as not to enter fresh air outside in it, And with no desiccant.
- Placing in a dark place where neither exposure to direct sunlight nor light is. Keeping temperature in the specified storage temperature range.
- Storing with no touch on polarizer surface by the anything else. (It is recommended to store them as they have been contained in the inner container at the time of delivery)

#### (7) Safety

- It is recommendable to crash damaged or unnecessary LCD into pieces and wash off liquid crystal by using solvents such as acetone and ethanol.

Which should be burned up later.

-When any liquid crystal leaked out of a damaged glass cell comes in contact with your hands, please wash it off well with soap and water.
