Advance Information Intelligent Power Module (IPM) 600 V, 10 A

The STK5Q4U362J-E is a fully-integrated inverter power stage consisting of a high-voltage driver, six IGBT's and a thermistor, suitable for driving permanent magnet synchronous (PMSM) motors, brushless-DC (BLDC) motors and AC asynchronous motors. The IGBT's are configured in a 3-phase bridge with separate emitter connections for the lower legs for maximum flexibility in the choice of control algorithm. The power stage has a full range of protection functions including cross-conduction protection, external shutdown and under-voltage lockout functions. An internal comparator and reference connected to the over-current protection circuit allows the designer to set the over-current protection level.

Features

- Three-phase 10 A / 600 V IGBT module with integrated drivers
- Typical values : $V_{CE(sat)} = 1.8 \text{ V}$, $V_F = 1.5 \text{ V}$, $E_{SW} = 390 \mu\text{J}$ at 10 A
- Compact 29.6 mm × 18.2 mm dual in-line package
- Cross-conduction protection
- Adjustable over-current protection level
- Integrated bootstrap diodes and resistors
- Enable pin
- Thermistor

Typical Applications

- Industrial Pumps
- Industrial Fans
- Industrial Automation
- Home Appliances

APPLICATIONS INFORMATION

Input / Output Timing Chart

Figure 12. Input/Output Timing Chart

Notes

1. This section of the timing diagram shows the effect of cross-conduction prevention.
2. This section of the timing diagram shows that when the voltage on V_{DD} decreases sufficiently all gate output signals will go low, switching off all six IGBTs. When the voltage on V_{DD} rises sufficiently, normal operation will resume.
3. This section shows that when the bootstrap voltage V_{BS} drops, the corresponding high side output (U or V or W) is switched off. When V_{BS} rises sufficiently, normal operation will resume.
4. This section shows that when the voltage on ITRIP exceeds the threshold, all IGBT's are turned off. Normal operation resumes later after the over-current condition is removed.
5. After V_{DD} has risen above the threshold to enable normal operation, the driver waits to receive an input signal on the LIN input before enabling the driver for the HIN signal.

Figure 13. Thermistor Resistance versus Case Temperature

Figure 14. Thermistor Voltage versus Case Temperature
Conditions : RTH = 39 kΩ, pull-up voltage 5.0 V (see Figure 2)

Fault output

The FAULT output is an open drain output requiring a pull-up resistor. If the pull-up voltage is 5 V, use a pull-up resistor with a value of 6.8 kΩ or higher. If the pull-up voltage is 15 V, use a pull-up resistor with a value of 20 kΩ or higher. The FAULT output is triggered if there is a V_{DD} undervoltage or an overcurrent condition.

Undervoltage lockout protection

If V_{DD} goes below the V_{DD} supply undervoltage lockout falling threshold, the FAULT output is switched on. The FAULT output stays on until V_{DD} rises above the V_{DD} supply undervoltage lockout rising threshold. After V_{DD} has risen above the threshold to enable normal operation, the driver waits to receive an input signal on the LIN input before enabling the driver for the HIN signal.

Overcurrent protection

An over-current condition is detected if the voltage on the ITRIP pin is larger than the reference voltage. There is a blanking time of typically 350 ns to improve noise immunity. After a shutdown propagation delay of typically 1.1 μs, the FAULT output is switched on. The FAULT output is held on for a time determined by the resistor and capacitor connected to the RCIN pin. If RCLR = 2 MΩ and CCLR = 1 nF, the FAULT output is switched on for 1.65 ms (typical).

The over-current protection threshold should be set to be equal or lower to 2 times the module rated current (IO).

An additional fuse is recommended to protect against system level or abnormal over-current fault conditions.

Capacitors on High Voltage and V_{DD} supplies

Both the high voltage and V_{DD} supplies require an electrolytic capacitor and an additional high frequency capacitor.

Enable pin

The ENABLE terminal pin is used to enable or shut down the built-in driver. If the voltage on the ENABLE pin rises above the ENABLE ON-state voltage the output drivers are enabled. If the voltage on the ENABLE pin falls below the ENABLE OFF-state voltage, the drivers are disabled.

Minimum input pulse width

When input pulse width is less than 1 μs, an output may not react to the pulse. (Both ON signal and OFF signal)

Calculation of bootstrap capacitor value

The bootstrap capacitor value CB is calculated using the following approach. The following parameters influence the choice of bootstrap capacitor:

- VBS : Bootstrap power supply. 15 V is recommended.
- QG : Total gate charge of IGBT at V_{BS} = 15 V. 45 nC
- UVLO : Falling threshold for UVLO. Specified as 12 V.
- I_{DMAX} : High side drive consumption current. Specified as 0.4 mA
- t_{ONMAX} : Maximum ON pulse width of high side IGBT.

Capacitance calculation formula:

$$CB = (QG + I_{DMAX} * t_{ONMAX}) / (VBS - UVLO)$$

CB is recommended to be approximately 3 times the value calculated above. The recommended value of CB is in the range of 1 to 47 μF, however, the value needs to be verified prior to production. When not using the bootstrap circuit, each high side driver power supply requires an external independent power supply.

The internal bootstrap circuit uses a MOSFET. The turn on time of this MOSFET is synchronized with the turn on of the low side IGBT. The bootstrap capacitor is charged by turning on the low side IGBT.

If the low side IGBT is held on for a long period of time (more than one second for example), the bootstrap voltage on the high side MOSFET will slowly discharge.

Mounting Instructions

Item	Recommended Condition
Pitch	26.0 ±0.1 mm (Please refer to Package Outline Diagram)
Screw	Diameter : M3 Screw head types: pan head, truss head, binding head
Washer	Plane washer dimensions (Figure 16) D = 7 mm, d = 3.2 mm and t = 0.5 mm JIS B 1256
Heat sink	Material : Aluminum or Copper Warpage (the surface that contacts IPM) : -50 to 50 µm Screw holes must be countersunk. No contamination on the heat sink surface that contacts IPM.
Torque	Temporary tightening : 50 to 60% of final tightening on first screw Temporary tightening : 50 to 60% of final tightening on second screw Final tightening : 0.4 to 0.6 Nm on first screw Final tightening : 0.4 to 0.6 Nm on second screw
Grease	Silicone grease. Thickness : 50 to 100 µm Uniformly apply silicone grease to whole back. Thermal foils are only recommended after careful evaluation. Thickness, stiffness and compressibility parameters have a strong influence on performance.
