Motion SPM[®] 5 SUPERFET[®] Series

General Description

The FSB50760BSF / FSB50760BSFS is an advanced Motion SPM 5 module providing a fully-featured, high-performance inverter output stage for AC Induction, BLDC and PMSM motors such as refrigerators, fans and pumps. These modules integrate optimized gate drive of the built-in MOSFETs (SuperFET technology) to minimize EMI and losses, while also providing multiple on-module protection features including under-voltage lockouts and thermal monitoring. The built-in high-speed HVIC requires only a single supply voltage and translates the incoming logic-level gate inputs to the high-voltage, high-current drive signals required to properly drive the module's internal MOSFETs. Separate open-source MOSFET terminals are available for each phase to support the widest variety of control algorithms.

NOTES:

5. BV_{DSS} is the Absolute Maximum Voltage Rating Between Drain and Source Terminal of Each MOSFET Inside Motion SPM 5 product. V_{PN} Should be Sufficiently Less Than This Value Considering the Effect of the Stray Inductance so that V_{DS} Should Not Exceed BV_{DSS} in Any Case.
6. t_{ON} and t_{OFF} Include the Propagation Delay Time of the Internal Drive IC. Listed Values are Measured at the Laboratory Test Condition, and They Can be Different According to the Field Applications Due to the Effect of Different Printed Circuit Boards and Wirings. Please see Figure 6 for the Switching Time Definition with the Switching Test Circuit of Figure 7.
7. The peak current and voltage of each MOSFET during the switching operation should be included in the Safe Operating Area (SOA). Please see Figure 6 for the RBSOA test circuit that is same as the switching test circuit.
8. V_{TS} is only for sensing temperature of module and cannot shutdown MOSFETs automatically.
9. Built in bootstrap diode includes around 15Ω resistance characteristic. Please refer to Figure 2.

FSB50760BSF / FSB50760BSFS

These values depend on PWM control algorithm

- Parameters for bootstrap circuit elements are dependent on PWM algorithm. For 15 kHz of switching frequency, typical example of parameters is shown above.
- RC coupling (R₅ and C₅) and C₄ at each input of Motion SPM and Microm (Indicated as Dotted Lines) may be used to prevent improper signal due to surge noise.
- Bold lines should be short and thick in PCB pattern to have small stray inductance of circuit, which results in the reduction of surge voltage. Bypass capacitors such as C₁, C₂ and C₃ should have good high frequency characteristics to absorb high-frequency ripple current.

Figure 3. Recommended MCU Interface and Bootstrap Circuit with Parameters

- Attach the thermocouple on top of the heatsink-side of SPM (between SPM 5 package and heatsink if applied) to get the correct temperature measurement.

Figure 8. Under-Voltage Protection (Low-Side)

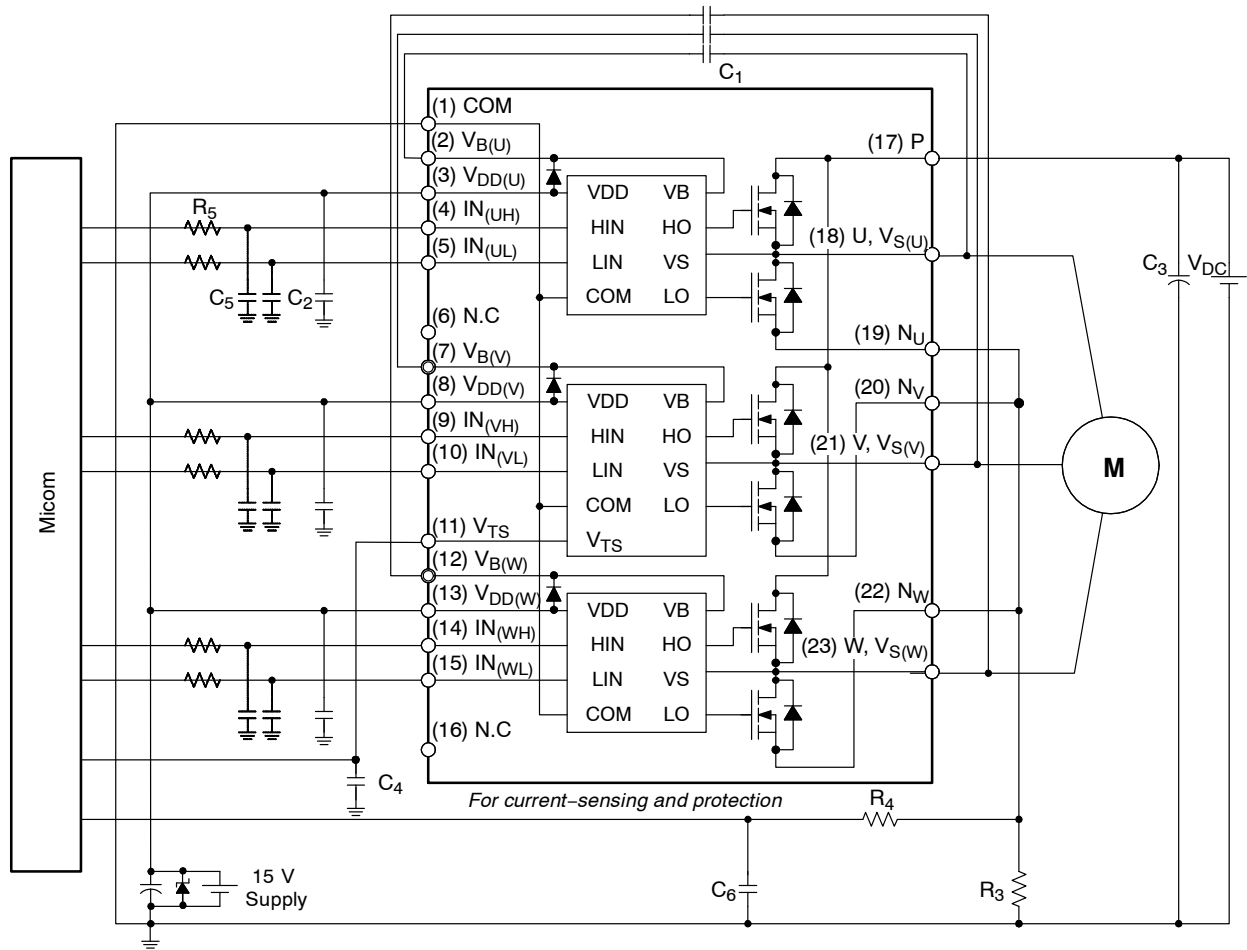

Figure 9. Under-Voltage Protection (High-Side)

FSB50760BSF / FSB50760BSFS

14. About pin position, refer to Figure 1.
15. RC coupling (R₅ and C₅, R₄ and C₆) and C₄ at each input of Motion SPM 5 product and Microm are useful to prevent improper input signal caused by surge noise.
16. The voltage drop across R₃ affects the low side switching performance and the bootstrap characteristics since it is placed between COM and the source terminal of the low side MOSFET. For this reason, the voltage drop across R₃ should be less than 1 V in the steady-state.
17. Ground wires and output terminals, should be thick and short in order to avoid surge voltage and malfunction of HVIC.
18. All the filter capacitors should be connected close to Motion SPM 5 product, and they should have good characteristics for rejecting high-frequency ripple current.
