

## MAX38903A/MAX38903B/ MAX38903C/MAX38903D

## 1.7V–5.5V<sub>IN</sub>, 1A Low Noise LDO Linear Regulators in TDFN and WLP

### General Description

The MAX38903A/B/C/D are a family of low-noise linear regulators that deliver up to 1A of output current with only 5.5µVRMS of output noise from 10Hz to 100kHz.

These regulators maintain ±1% output accuracy over a wide input voltage range, requiring only 100mV of input-to-output headroom at full load. The 1200µA no-load supply current is independent of dropout voltage. The MAX38903A/B/C/D has an 800Ω active discharge feature to quickly discharge output capacitors.

The MAX38903A has nine pin-selectable output voltages 1.2V, 1.5V, 1.8V, 2.5V, 3.0V, 3.1V, 3.3V, 4.0V, and 5V. The MAX38903B/C output voltage can be adjusted to a value in the range of 0.6V to 5.0V using two external resistors.

The MAX38903B also includes an active-high POK signal for trouble-free load startup.

The MAX38903D has factory-preset output voltages over the range of 0.7V to 5V in 50mV steps. All versions include a programmable output soft-start rate, output over-current and thermal overload protection.

The MAX38903A/B are offered in a 10-pin, 3mm x 3mm TDFN package, while the MAX38903C/D are offered in a 9-bump, 0.4mm pitch, 1.4mm x 1.4mm wafer-level package (WLP).

### Applications

- Communication Systems, Test Equipment, Medical Equipment
- High-End Audio Systems
- High-Resolution Data Acquisition Systems

### Benefits and Features

- Delivers Flexible Operating Range
  - 1.7V to 5.5V Input Voltage Range
  - 0.6V to 5.0V Programmable Output Voltage
  - 1A Maximum Output Current
  - 100mV Maximum Dropout at 1A Load
  - <1µA Shutdown Supply Current
- Reduces Noise and Improves Accuracy
  - ±1% DC Accuracy Over Load, Line, and Temperature
  - 5.5µVRMS Output Noise, 10Hz to 100kHz
  - 1200µA Operating Supply Current
  - 70dB PSRR at 10kHz
- Enables Ease-of-Use and Robust Protection
  - Active Discharge of 800Ω at OUT
  - Stable with 4µF(min) Output Capacitance
  - Programmable Soft-Start Rate
  - Overcurrent and Overtemperature Protection
  - Output-to-Input Reverse Current Protection
  - Power-OK Output
- Reduces Size, Improves Reliability
  - 3mm x 3mm, 10-pin TDFN Package and 1.4mm x 1.4mm, 3 x 3 Bump, 0.4mm Pitch WLP
  - -40°C to 125°C Operating Temperature

Typical Operating Circuits

MAX38903A/MAX38903B/  
MAX38903C/MAX38903D

1.7V–5.5V<sub>IN</sub>, 1A Low Noise LDO Linear  
Regulators in TDFN and WLP

**Absolute Maximum Ratings**

IN, EN, POK, RSEL, BYP to GND .....	-0.3V to +6V	Operating Temperature Range .....	-40°C to +125°C
FB, OUT, OUTS, SELA, SELB to GND .....	-0.3V to +6V	Maximum Junction Temperature .....	+150°C
Output Short-Circuit Duration .....	Continuous	Storage Temperature Range .....	-65°C to +150°C
Continuous Power Dissipation (T <sub>A</sub> = +70°C)		Lead Temperature (Soldering, 10 seconds) .....	+300°C
TDFN (derate 24.4mW/°C above 70°C) .....	1951mW	Soldering Temperature (reflow) .....	+260°C
WLP (derate 11.9mW/°C above 70°C) .....	952mW		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Package Information**

**TDFN**

Package Code	T1033+1C
Outline Number	<a href="#">21-0137</a>
Land Pattern Number	<a href="#">90-0003</a>
<b>THERMAL RESISTANCE, SINGLE-LAYER BOARD</b>	
Junction to Ambient (θ <sub>JA</sub> )	54°C/W
Junction to Case (θ <sub>JC</sub> )	9°C/W
<b>THERMAL RESISTANCE, FOUR-LAYER BOARD</b>	
Junction to Ambient (θ <sub>JA</sub> )	41°C/W
Junction to Case (θ <sub>JC</sub> )	9°C/W

**WLP**

Package Code	N91D1+1
Outline Number	<a href="#">21-100257</a>
Land Pattern Number	Refer to <a href="#">Application Note 1891</a>
<b>THERMAL RESISTANCE, FOUR-LAYER BOARD</b>	
Junction to Ambient (θ <sub>JA</sub> )	83.98°C/W
Junction to Case (θ <sub>JC</sub> )	N/A

For the latest package outline information and land patterns (footprints), go to [www.maximintegrated.com/packages](http://www.maximintegrated.com/packages). Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

## Pin Configurations

### MAX38903A

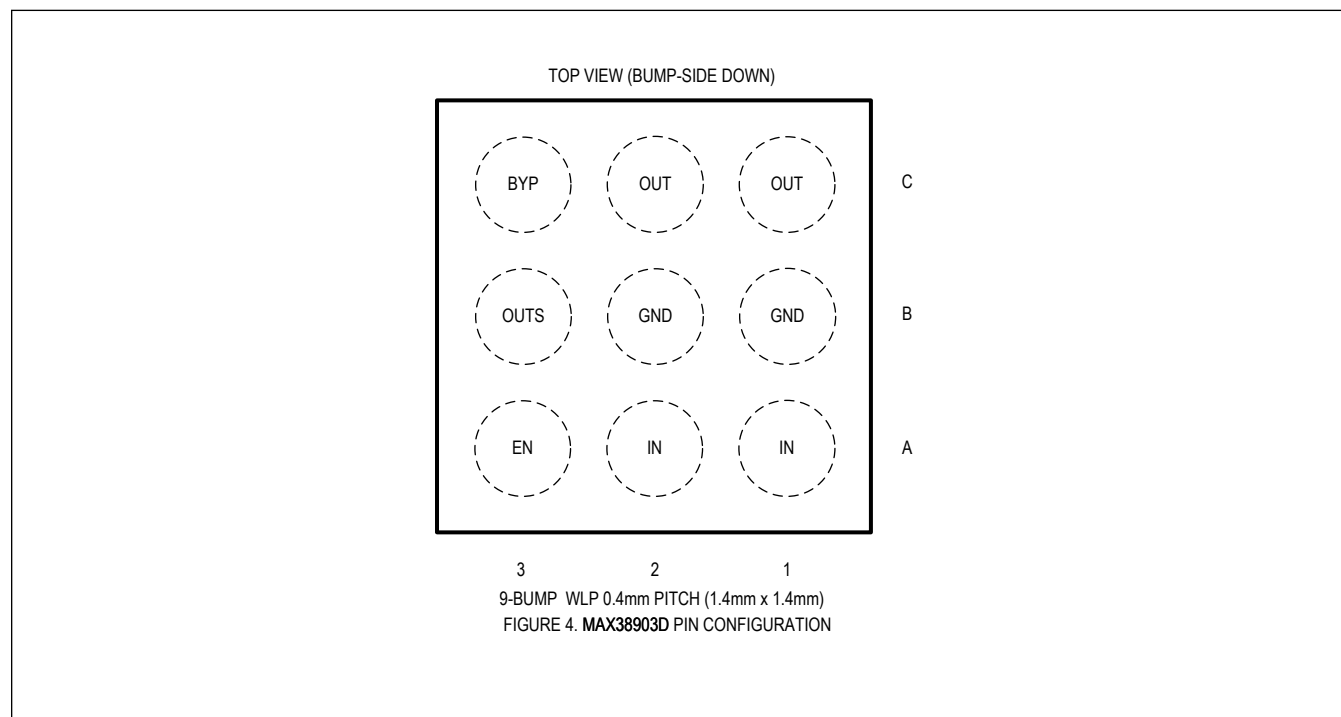

**MAX38903B**

**MAX38903C**

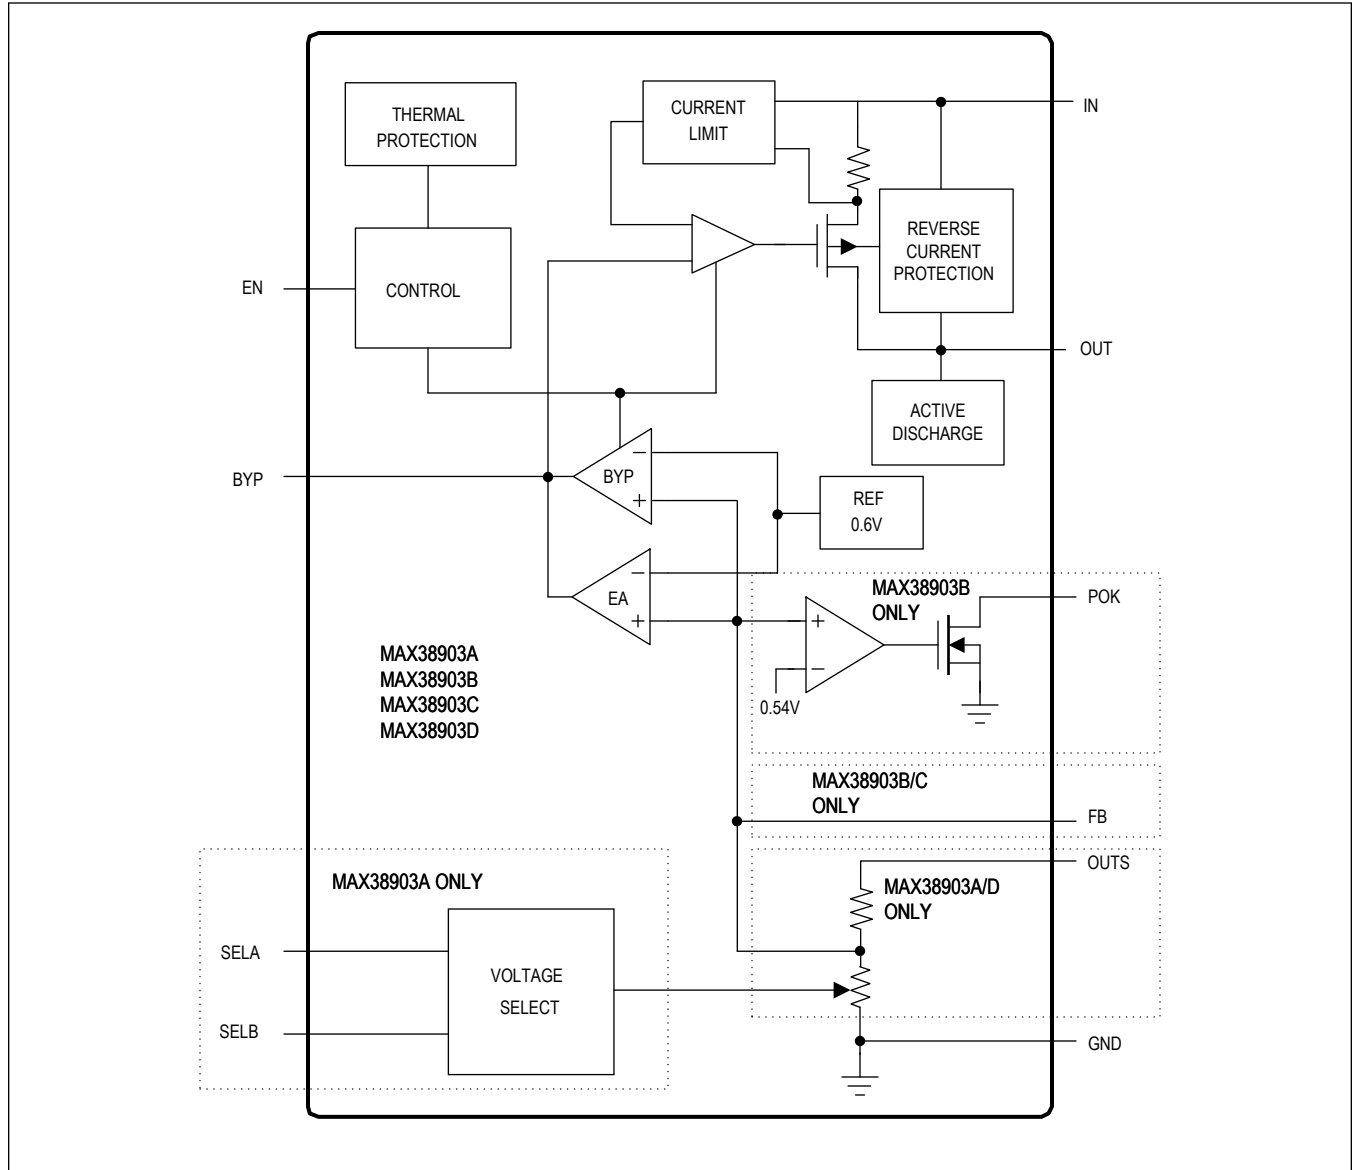

**MAX38903D**

## Pin Description

PIN				NAME	FUNCTION
MAX38903A	MAX38903B	MAX38903C	MAX38903D		
1, 2	1, 2	A1, A2	A1, A2	IN	Regulator Supply Input. Connect to a voltage between 1.7V and 5.5V and bypass with a 10μF capacitor from IN to GND.
3	3	B1, B2	B1, B2	GND	Regulator Ground. Bring IN and OUT bypass capacitor GND connections to this pin for best performance.
4	4	A3	A3	EN	Enable Input. Connect this pin to a logic signal to enable ( $V_{EN}$ high) or disable ( $V_{EN}$ low) the regulator output. Connect to IN to keep the output enabled whenever a valid supply voltage is present. When EN is pulled low or disabled, output is shorted to GND through an 800Ω active discharge circuit.
5	-	-	-	SELA	Select Input A. Connect to GND, IN, or leave unconnected to select the output voltage. This pin is read only at startup
-	5	-	-	GS	Ground Sense. Connect GS to GND.
6	-	-	-	SELB	Select Input B. Connect to GND, IN, or leave unconnected to select the output voltage. This pin is read only at startup
-	6	-	-	POK	Active-High Power-OK Output. Connect a pullup resistor from this pin to a supply to create a reset signal that goes high after the regulator output has reached its regulation voltage.
7	-	-	B3	OUTS	Output Voltage Sense Input. Connect to the load at a point where accurate regulation is required to eliminate resistive metal drops.
-	7	B3	-	FB	Feedback Divider Input. Connect a resistor divider string from OUT to GND with the midpoint tied to this pin to set the output voltage. In the Typical Operating Circuits, $V_{OUT} = 0.6V \times (1 + R3/R2)$ .
8	8	C3	C3	BYP	Bypass Capacitor Input. Connect a 0.001μF to 0.1μF capacitor between OUT and BYP to reduce output noise and set the regulator soft-start rate.
9, 10	9, 10	C1, C2	C1, C2	OUT	Regulator Output. Sources up to 1A at the output regulation voltage. Bypass with a 10μF (4μF minimum, including voltage derating) low ESR (< 0.03Ω) capacitor to GND.
EP	EP	—	—	EP	Exposed Pad (TDFN Only). Connect the exposed pad to a ground plane with low thermal resistance to ambient to provide best heatsinking.

**Simplified Functional Diagram**

## Detailed Description

The MAX38903A/B/C/D low noise linear regulators deliver up to 1A of output current with only 5.5µV<sub>RMS</sub> of output noise in a 10Hz to 100kHz bandwidth. These regulators maintain their output voltage over a wide input range, requiring only 100mV of input-to-output headroom at full load.

The MAX38903A/B/C/D maintains a low 1200µA (typ) supply current, independent of the load current and dropout voltage. The regulator control circuitry includes a programmable soft-start circuit, short-circuit, reverse input current, and thermal overload protection. Other features include an enable input and power-ok (POK) output (MAX38903B only). See [Simplified Functional Diagram](#).

### Enable (EN)

The MAX38903A/B/C/D include an enable input (EN). Pull EN low to shut down the output, or drive EN high to enable the output. If a separate shutdown signal is not available, connect EN to IN. When EN is pulled low, output voltage is pulled to ground through an 800Ω active discharge circuit.

### Bypass (BYP)

The capacitor connected from BYP to OUT filters the noise of the reference, feedback resistors and regulator input stage, and provides a high-speed feedback path for improved transient response. A 0.01µF capacitor rolls-off input noise at around 32Hz.

The slew rate of the output voltage during startup is also determined by the BYP capacitor. A 0.01µF capacitor sets the slew rate to 5V/ms. This startup rate results in a 50mA slew current drawn from the input at start-up to charge the 10µF output capacitance.

The BYP capacitor value can be adjusted from 0.001µF to 0.1µF to change the startup slew rate according to the following formula:

$$\text{Startup Slew Rate} = (5\text{V/ms}) \times (0.01\mu\text{F}/C_{\text{BYP}})$$

where  $C_{\text{BYP}}$  is in µF.

Note that this slew rate applies only at startup. Recovery from a short-circuit will occur at a slew rate approximately 500 times slower.

Also note that, being a low-frequency filter node, BYP is sensitive to leakage. BYP leakage currents above 10nA cause measurable inaccuracy at the output and should be avoided.

### Protection Features

The MAX38903A/B/C/D are fully protected from an output short-circuit by a current-limiting and thermal overload circuit. If the output is shorted to GND, the output current is limited to 1.4A (typ). Under these conditions, the part quickly heats up. When the junction temperature reaches 165°C, a thermal limit circuit shuts off the output device. When the junction cools to 150°C, the output turns back on in an attempt to reestablish regulation. While the fault persists, the output current cycles on and off as the junction temperature slews between 150°C and 165°C.

The MAX38903A/B/C/D are also protected against reverse current when the output voltage is higher than the input. In the event that extra output capacitance is used at the output, a power-down transient at the input would normally cause a large reverse current through a conventional regulator. The MAX38903A/B/C/D include a reverse voltage detector that trips when IN drops 10mV below OUT, shutting off the regulator and opening the pMOS body diode connection, preventing any reverse current.

### Active Discharge

When EN is pulled low, the MAX38903A/MAX38903B/MAX38903C/MAX38903D connects an 800Ω resistor from OUT to GND in order to discharge the output capacitors. This feature reduces the time required to discharge the output capacitor, which simplifies system power sequencing.

### Output Voltage Configuration (MAX38903A)

The MAX38903A output can be set to one of nine voltages by shorting or opening the SELA and SELB inputs, as shown in [Table 1](#). SELA and SELB should be connected to GND, IN, or left unconnected. Alternatively, they may be driven high, low, or open with external logic. However, the states of SELA and SELB are sampled only at startup. The regulation voltage can be set to a different level by cycling EN or IN momentarily to GND.

**Table 1. MAX38903A Output Configuration**

V <sub>OUT</sub> (V)	SELA STATE	SELB STATE
1.2	Unconnected	IN
1.5	IN	Unconnected
1.8	Unconnected	GND
2.5	Unconnected	Unconnected
3.0	GND	GND
3.1	GND	IN
3.3	GND	Unconnected
4.0	IN	GND
5.0	IN	IN

### Output Voltage Configuration (MAX38903B/C)

The MAX38903B and MAX38903C use external feedback resistors to set the output regulation voltage, as shown in the Typical Operating Circuits. The output can be set

from 0.6V to 5.0V. Set the lower feedback resistor R2 to 300kΩ or less to minimize FB input bias current error. Then calculate the value of the upper feedback resistor R1, as follows:

$$R1 = R2 \times \left( \frac{V_{OUT}}{V_{FB}} - 1 \right)$$

where V<sub>FB</sub> is the feedback regulation voltage of 0.6V. To set the output voltage to 2.5V, for example, R1 should be:

$$R1 = 300\text{k}\Omega \times \left( \frac{2.5\text{V}}{0.6\text{V}} - 1 \right) = 950\text{k}\Omega$$

### Output Voltage Configuration (MAX38903D)

The MAX38903D output voltage comes pre-programmed to values listed below. Additionally, any voltage between 0.7V and 5.0V in 50mV steps can be factory trimmed and special ordered.

### Power-OK (MAX38903B)

The MAX38903B includes an additional open-drain output (POK) that goes high to indicate the output voltage is in regulation. Connect a pullup resistor from this pin to an external supply. During startup, POK stays low until the output voltage rises to 91%(typ) of its regulation level. If an overload occurs at the output, or the output is shutdown, POK goes low.

### Input Capacitor

A 10μF ceramic capacitor is recommended for the input. Select a capacitor that does not degrade significantly over temperature and DC bias. Capacitors with X5R or X7R temperature characteristics generally perform well.

### Output Capacitor

A minimum of 4μF capacitance is required at OUT to ensure stability. Select a ceramic capacitor that maintains its capacitance (4μF minimum) over temperature and DC bias. Capacitors with X5R or X7R temperature characteristics generally perform well.

---

MAX38903A/MAX38903B/  
MAX38903C/MAX38903D

1.7V–5.5V<sub>IN</sub>, 1A Low Noise LDO Linear  
Regulators in TDFN and WLP

### Thermal Considerations

The MAX38903A/B is packaged in a 10-pin 3mm x 3mm TDFN package with an exposed paddle. The exposed paddle is the main path for heat to leave the IC, and therefore must be connected to a ground plane with thermal vias to allow heat to dissipate from the device. Thermal properties of the IC package are given in the [Package Information](#) section.
