

MAX38803 Evaluation Kit

Evaluates: MAX38803

General Description

The MAX38803 evaluation kit (EV kit) serves as a reference platform for evaluating the MAX38803 voltage regulator IC. This single-chip, integrated switching regulator provides an extremely compact, highly efficient, fast, accurate, and reliable power delivery solution for low-output voltage applications. The MAX38803 has different programmability options to enable a wide range of configurations.

The EV kit consists of a fully-assembled and tested Printed Circuit Board (PCB) implementation of the MAX38803. Jumpers, test points, and input/output connectors are included for flexibility and ease-of-use. Refer to the data sheet for ordering information and more details.

Applications

- Servers/ μ Servers
- I/O and Chipset Supplies
- GPU Core Supply
- DDR Memory—VDDQ and VTT
- Point-of-Load (PoL) Applications

Ordering Information appears at end of data sheet.

Features

- High-Efficiency Solution
 - Up to 97% Peak
 - Up to 87% at Full Load
 - Up to 96% Light Load Efficiency at 1A with DCM Enabled
- Inductor Valley Current Limit is Configured to 16A ($R_SEL = R1 = 6.04k\Omega$)
- Programmable Switching Frequency from 400kHz to 900kHz
- Programmable Positive and Negative OCP Limit
- Programmable Reference Voltage with External Input Option
- Fast Transient Response with Quick-PWM™ Architecture
- Differential Remote Sense with Open-Circuit Detection
- Percentage-Based Output Power Good and OVP
- Open-Drain Status Indicator (STAT) Pin
- Input Undervoltage and Overvoltage Lockout
- Adaptive Dead Time Control
- Integrated Boost Switch
- 27-Bump WLCSP (2.2mm x 3.8mm) Footprint
- Operation Using Ceramic Input and Output Capacitors

Quick Start

Required Equipment

- MAX38803 EV kit
- 12V, 10A DC power supply
- Load capable of sinking 16A
- Digital voltmeter
- Oscilloscope

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify the board operation. **Caution: Do not turn on power supply until all connections are completed.**

- 1) Connect a 12V power supply to the VDD1 and GND1 banana jacks.
- 2) Make sure the shunt is installed on:
 - a) J16 (1-2) to close the sense line.
 - b) J4 (1-2) to power up the on-board LDO which regulates 1.8V.
 - c) J12 (1-2) to provide the 1.8V bias supply to the regulator from the on-board LDO.
 - d) J15 (3-5) to pull up the STAT pin.
 - e) J15 (4-6) to pull up the OE pin.
 - f) J15 (2-4) to pull down/disable the OE pin.
- 3) Connect a voltmeter to the VOUT and GND banana jacks (J8, J11, J13, and J14 can be used as well).
- 4) Turn on the power supply.
- 5) Verify that the voltmeter reads 2.5V.

Detailed Description of Hardware

The MAX38803 provides compact, high-efficiency power delivery for precision outputs that demand fast transient response. The 27-bump (2.2mm x 3.8mm) WLCSP package minimizes the printed circuit board area. The EV kit is preset for 2.5V output and can provide up to 16A from a 6.5V to 14V input supply.

Bias Supply

The MAX38803 EV kit has an on-board LDO (U2) that can provide the required 1.8V VCC bias voltage to the regulator

as well as the pull up voltage for the Output Enable (OE) input. This allows testing the part using a single external power supply.

To enable the on-board LDO install the shunt on jumper J4. To effectively use the LDO to supply the VCC bias voltage to the regulator also install the shunt on jumper J12.

In order to properly measure the efficiency of the regulator, the LDO should not be active. To disable the LDO, both the shunts on J4 and J12 need to be removed. An external 1.8V, 0.1A current limited power supply needs to be connected between J12-2 and ground. The same signal should be connected to J10 (1-2) to pull up the OE pin.

Regulator Enable

To enable the regulator, the OE pin needs to be pulled high. If the on-board 1.8V LDO is active (the shunt on jumper J4 is in place), the output voltage can be used for the purpose. Installing a shunt on J15 (4-6) pulls the OE signal high to 1.8V through a 20k Ω resistor. To shut down the regulator, a shunt needs to be installed on J10. This forces the OE pin low.

Status Pin

The MAX38803 has an open collector status (STAT) output to report fault or output undervoltage and output overvoltage event. Install a shunt on J15 (3-5) to pull up this pin to V_{CC} through a 20k Ω resistor. Since STAT pin is 1.8V tolerant, a shunt on J15 (1-3) can be installed to pull up this pin through a 20k Ω resistor to the 1.8V provided by the on-board regulator U2.

Scenario Selection

Several parameters of the MAX38803 can be programmed to allow optimization for specific applications. By selecting the appropriate value of resistor R_SEL (R1) and capacitor C_SEL (C4), the optimum set of parameters (scenario) can be programmed.

While R_SEL selects the proper scenario, C_SEL determines the nominal F_{SW}. [Table 1](#) shows the configuration table for MAX38803.

Setting the Output Voltage

The output voltage of the MAX38803 depends both on the reference voltage (V_{REF}) and the resistor divider ratio.

Equation 1

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R_6}{R_9} \right)$$

The reference voltage is selected through RSEL (see Table 1) and can be either internal or external (refer to the data sheet for more details). In order to optimize the common mode rejection of the error amplifier, choose the voltage divider resistors so that their parallel resistance R_{PAR} is as close as possible to $2k\Omega$.

Equation 2

$$R_6 = V_{OUT} \times \left(\frac{R_{PAR}}{V_{REF}} \right)$$

$$R_9 = R_6 \times \left(\frac{R_{PAR}}{R_6 - R_{PAR}} \right)$$

where,

R_6 = Top divider resistor

R_9 = Bottom divider resistor

R_{PAR} = Desired parallel resistance of R_6 and R_9

V_{OUT} = Output voltage

V_{REF} = Reference voltage

Operation with External V_{REF}

When using an external reference adopt the configuration shown in Figure 1. Once OE is asserted, the regulator briefly discharges the SENSE- node and releases it as regulation begins. In this case, the soft-start ramp is determined by the external low-pass filter time constant. The external filter time constant needs to be lower than $T_{SS}/3$ in order to avoid premature assertion of STAT pin while the output voltage is still ramping.

The external reference voltage can be applied prior to enabling the regulator, or ramped up right after enable is asserted. In both cases, the low-pass filtered reference voltage at SENSE- pin must reach its final value within T_{SS} .

Typical values for the filter components are:

- $R_F = 2.2k\Omega$
- $C_F = 0.22\mu F$

Table 1. MAX38803 Configuration Table

R_SEL (kΩ)	V_REF (V)	SOFT-START TIME (T _{SS}) (ms)	VALLEY OCP INCEPTION (A)	OPERATION MODES	REPORTING (CURRENT/TEMP)	RSENSE (GAIN) (mΩ)	F _{sw} (kHz)			T _{STAT} (μs)

Input Voltage Monitoring

VDD1 and GND1 sense points as well as J3 can be used to monitor the input supply.

Output Voltage Monitoring

J11 and J13 monitor the output voltage. These test points should not be used for loading. Use scopejack J14 to monitor the output voltage ripple on an oscilloscope.

Efficiency Measurement

The following steps describe how to measure the regulator efficiency.

- 1) Connect a 12V power supply to the VDD1 and GND1 banana jacks. To avoid the input voltage to drop at high load due to power losses on connection cables connect the sense lines of the power supply to VDD1 and GND1 headers.
- 2) Connect an external 1.8V, 0.1A current limited power supply between J12-2 and ground
- 3) Connect the same power supply to J10-1 to enable the regulator.

- 4) Connect a load to the VOUT and GND banana jacks for better results. J8 can also be used for low currents.
- 5) Make sure the shunt is installed on J16 (1-2) to close the sense line.
- 6) Remove all the other jumpers.
- 7) Connect a voltmeter to J11 or J13.
- 8) Turn on the power supply.
- 9) Measure V_{IN} , I_{IN} , V_{OUT} , I_{OUT} , V_{BIAS} , and I_{BIAS} .
- 10) Calculate the efficiency as:

Equation 3

$$\eta = \left(\frac{V_{OUT} \times I_{OUT}}{(V_{IN} \times I_{IN}) + (V_{BIAS} \times I_{BIAS})} \right)$$
