## RPX-1.5-EVM-1

### Description

The RPX-1.5-EVM-1 generates a constant output voltage selectable from 0.8V, 1.8V, 3.3V, 5V, 12V, 15V, or 24V from a DC input in the range of 4-36V. It has a maximum continuous output current of 1.5A.

All the functions of the RPX-1.5 such as output voltage selection, control, power good, trim, and output sense can be readily evaluated. Also the behavior in overload or over-temperature can be evaluated easily before it is designed in.

The evaluation board also contains the filter components to meet EMC class B levels. Alternate component positions are included to allow experimentation to optimize the EMC performance depending on operating conditions and budget.

### Selection Guide

Part Number	Input Voltage Range [VDC]	Output Voltage <sup>(1)</sup> [VDC]	Output Current max. [A]
RPX-1.5-EVM-1	4 - 36	0.8, 1.8, 3.3, 5, 12, 15, 24	1.5

#### Notes:

Note1: refer to [SAFE OPERATING AREA](#) of RPX-1.5 datasheet

### Quick Start Guide

1. Connect P3 to power supply (observe correct polarity!)
2. Connect P4 to the load (no load operation is allowed. For 0.8Vout, please refer to safe operating area in the [RPX-1.5](#) datasheet)
3. The evaluation module is preset to 5Vout.  
The output voltage can be selected with values of 0.8V, 1.8V, 3.3V, 5V, 12V, 15V, and 24V by shorting a 0Ω resistor to the respective places as seen in the board silkscreen. For 0.8Vout, please refer to safe operating area in the [RPX-1.5](#) datasheet.
4. The sense pin is connected to the RPX output pin, so the preset voltage is very accurate at the output of the RPX. To compensate any losses of the filter, remove the resistor at R2, and solder a 0Ω resistor at R3.
5. CTRL  
The device is preset as normally on. It can be disabled by pulling the CTRL pad to GND. Short R18 to disable the device.

#### Caution:

ESD sensitive. Always follow ESD preventative procedures when handling the product!

### Description

U1: RPX-1.5 power module.

C1,C2,L1,L2,L3,L4,L5,L6,C3,C4,C5,C6: allow placement of various sized components to test input filter design. The populated filter is designed to meet EN55022 class B.

C7,C8,C9,C10,L7,L8,L9,C11: allow placement of various sized components to test output filter design. The populated filter is designed to meet EN55022 class B.

R1 and R18: configure CTRL. R1 is populated to enable the RPX-1.5. Short R18 in order to disable the RPX-1.5.

R2: populated 0Ω resistor for direct output voltage measurement. If sense is desired at a different location, for example after the filter or directly at the load, unsolder R2, and connect sense to the new measurement point.

R3: sense point for output voltage after the filter. To set sense point here, remove R2, and solder a 0Ω resistor at R3.

VOUT selection: the output voltage can be selected with values of 0.8V, 1.8V, 3.3V, 5V, 12V, 15V, and 24V by shorting a 0Ω resistor to the respective places as seen in the board silkscreen.

R21, R22: trim the output voltage. Refer to **"OUTPUT VOLTAGE TRIMMING"**

### Specifications (measured @ Ta= 25°C, full load and after warm-up unless otherwise stated)

#### OUTPUT VOLTAGE TRIMMING

The RPX-1.5 offers the feature of trimming the output voltage by using external trim resistors. The values for trim resistors are shown in trim tables below according to E96 values; therefore, the specified voltage may slightly vary. Refer to “*Selection Guide*” for applicable Vout range.

#### Calculation:

- Vout<sub>nom</sub> = nominal output voltage [VDC]
- Vout<sub>set</sub> = trimmed output voltage [VDC]
- V<sub>ref</sub> = reference voltage [VDC]
- R<sub>up</sub> = trim up resistor [kΩ]
- R<sub>down</sub> = trim down resistor [kΩ]
- R<sub>Hi</sub>, R<sub>Lo</sub> = internal resistors [kΩ]

R <sub>Hi</sub>	R <sub>Lo</sub>	V <sub>ref</sub>
60k5Ω	75kΩ	0.807VDC

$$R_{up} = \left[ \frac{R_{Hi}}{V_{out\_set} - V_{nom}} \right] - 1k \quad R_{down} = \left[ \frac{(V_{out\_set} - V_{ref}) \times R_{Lo}}{V_{out\_nom} - V_{set}} \right]$$

#### Practical Example RPX-1.5, trim up:

$$V_{out\_set} = 5.1VDC$$

$$R_{up} = \left[ \frac{60k5\Omega}{5.1 - 5} \right] - 1k = \underline{605k\Omega}$$

$$R_{up} \text{ according to E96} \approx \underline{604k\Omega}$$

#### Practical Example RPX-1.5, trim down:

$$V_{out\_set} = 4VDC$$

$$R_{down} = \left[ \frac{(4 - 0.807) \times 75k\Omega}{5 - 4} \right] = \underline{239k\Omega}$$

$$R_{down} \text{ according to E96} \approx \underline{237k\Omega}$$
