

MicroBlower Disclosure

- A Microblower is a device to suck / discharge air, and liquids cannot be flushed directly. The body cannot be washed because it does not have a sealed structure and is not waterproof. Also, avoid using this product in environments with condensation.
- Since the Microblower sucks and discharges air, contaminants and dust in the air tend to accumulate inside the pump. The contaminants and dust will influence the operational time. Use the Microblower in a clean environment or use a filter to remove at least submicron level of contaminants to prevent particles and dust from entering. (* The use of a filter does not guarantee prevention of the characteristics deteriorating on the Microblower.)
- Particularly, the smoke from tobacco and mosquito-repellant incense, etc. influence the life span of the product. Do not use the product in any smoky environment.
- The Microblower cannot be used for automobile applications (including accessories). Do not use this product for automobiles.
- If the Microblower is used for medical applications, murata requires a special contract to cover the use in the medical application to be agreed before start of mass production. Please contact Murata for details.
